

# HUMAN SKULL & BRAIN ANATOMY

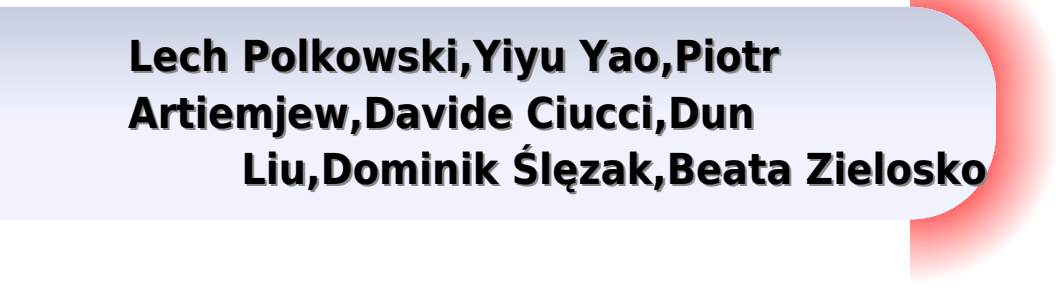

The human brain has the same general structure as the brains of other mammals, but has a more developed cerebral cortex than any other. Large animals such as whales and elephants have larger brains in absolute terms, but when measured using the encephalization quotient, which compensates for body size, the human brain is almost twice as large as the brain of the bottlenose dolphin, and three times as large as the brain of a chimpanzee. Much of the expansion comes from the cerebral cortex, especially the frontal lobes, which are associated with executive functions such as self-control, planning, reasoning, and abstract thought. The portion of the cerebral cortex devoted to vision, the visual cortex, is also greatly enlarged in humans.

## **Multi-Modal Electric and Magnetic Brain Imaging: Theory, Implementation, and Application** Sampsa

Pursiainen, Takfarinas Medani, Johannes Vorwerk, Richard Leahy, Maria-Carla Piastra, 2025-07-31

The computing resources of today in combination with high resolution individualized structural MRI scans enable advanced forward modeling in a wide range of bioelectromagnetic applications targeting the brain. Forward solvers are used in combination with inverse methods to localize neuronal sources. These solvers have evolved from analytical approaches using a single or multi-layered spherical domain towards realistic modeling tools based e.g. on the boundary and finite element methods BEMs and FEMs. Modern FEM methods using state of the art high resolution MRI numerical solvers and computing hardware can handle high resolution spatial discretization and advanced sensor models and incorporate tissue anisotropies. Similarly inverse methods can also make use of individualized MRI to support an inference of the brain activity e.g. through constraints on the placement of active neurons in the brain or on connectivity between neuronal populations inferred for diffusion MRI tractography. Through reciprocity similar approaches are also applicable to the modeling of electromagnetic brain stimulation. Integrating anatomical information and advanced forward and inverse approaches will be crucial in the development of the next generation of software tools for Spatiotemporal analysis of whole brain electrophysiology. This research topic aims to discover new approaches to solve multi-modal electric and magnetic brain imaging problems in source localization and stimulation as well as in complementary modalities such as impedance tomography. In particular our goal is to advance the development of unified solver approaches that can utilize the vast amount of volumetric information that is available today through high resolution and high contrast MRI scans and benefit from the complementarity of the different modalities. This issue will focus on novel methods that make use of high resolution MRI data in combination with novel approaches to modeling and inference applied to problems in source localization, modeling of brain stimulation and impedance tomography. These methods might make use of machine learning, dynamic modeling, filtering techniques or statistical inference. The scope covers new forward and inverse methods and multi-modal studies motivated by the following examples:

1. Integrating powerful volumetric forward simulation techniques with inverse approaches currently includes many open questions. These include for example the stability of a FEM-based source model inside a complex structured head model with high contrasts inside or the inverse effects that follow from using a realistic geometry.
2. Numerical implementations: their performance and experimental applications are welcome for instance in building an advanced inverse approach e.g. a dynamic Bayesian solver or a Machine Learning scheme which requires a solid interplay between different forward and inverse solver components.
3. Improving the level of multi-modality in inverse modeling for instance optimized stimulation and source localization approaches or complementary modalities can be coupled in a straightforward manner if a volumetric forward simulation is applied.

The scope includes but is not limited to the following invasive/non-invasive multimodal neuroimaging techniques and their application: Electroencephalography (EEG), Magnetoencephalography (MEG), Magnetic Resonance Imaging (MRI), Invasive

EEG sEEG iEEG ECOG DBS CCEPs and low power stimulation Neurotherapeutic approaches Transcranial Magnetic Stimulation TMS Transcranial Electric Stimulation TES Temporal Interference Stimulation TIS Functional MRI diffusion tensor imaging DTI Combined EEG MEG fMRI Functional Near Infrared Spectroscopy fNIRS Utilizing cutting edge artificial intelligence Machine Learning Deep Learning      *Encyclopedia of Infant and Early Childhood Development* ,2020-03-13
