It is actually scientists' names to challenge more, and more what the amounts (just revolutionary taught). They came to develop more, better methods of finding out how things worked. Mathematics knowledge increased and helped them to reason. They began to think up experiments to check on their ideas in a methodical way. The scientific revolution had begun.

Many more were needed to bring this about. These men came from every part of Europe. They wrote books to explain their ideas. The printing press made it possible to produce thousands of copies which forced their way all over Europe. Scientists were able to learn from one another and give one another new ideas. In the Scientific Revolution and the work of Englishmen, or Frenchmen, or Italian people, began the work of Europeans. And, as we have seen, each they did not do it all by themselves. The Chinese, the Indians, the Persians, and the Arabs all gave something before it came about. Today that is not hard to understand, because men and women from all over the world got to scientific knowledge and to help one another.

Document 2

As in mathematics, so in natural philosophy, the investigation of difficult things by the method of analysis is [scientific method], ought ever to precede the method of composition. This analysis is consisted in making experiments and observations, and in drawing general conclusions from them by induction [reason], and admitting of no objections against the conclusions, but such as are taken from experiments, or other certain truths. For hypotheses [theories] are not to be regarded in experimental philosophy. And although the arguing from experiments and observations by induction be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of, and may be looked upon as so much the stronger, by how much the induction is more general. And if no exception occur from phenomena [facts], the conclusion may be pronounced generally. But if at any time afterwards any exception shall occur from experiments, it may then begin to be considered with such exceptions as occur. By this way of analysis we may proceed from compounds to ingredients, and from motions to the forces producing them; and in general, from effects to their causes, and from particular cases to more general ones, till the argument end in the most general. This is the method of analysis [scientific method]; and the synthesis [combination of parts] comes late in arguing the causes discovered, and established as principles, and by them explaining the phenomena proceeding from them, and proving the explanations.
