## The Endocrine System

**Introduction:** Hormones are often referred to as "chemical messengers." These tiny messengers are created and released by one organ, pass into the bloodstream, and regulate the activity of another organ or cell. The pituitary, **adenohypophysis**, is created and released by the **adenohypophysis**. It is sent into the bloodstream and has specific activity either to cause or to inhibit an action in the body. Adrenocortical glands (not listed) can increase or decrease in a specific situation. The adrenal glands and the thyroid gland completely different body actions, but because it hormones these organs are "communicable."

Many organs in the human body. **Endocrine glands** are a distinct group of organs that make and release hormones into the bloodstream. These glands can be found throughout the body, but are concentrated in the head and collectively make up the **endocrine system**. In this activity, you will read about each endocrine gland, what it does, and how it makes hormones.

1. What is a hormone?

2. What is an example of a hormone?

3. What type of glands make hormones?

**Hypothalamus**

If you've studied the nervous system, you are familiar with the hypothalamus, a part of the brain. The hypothalamus receives information from the brain and bloodstream (in the form of "chemical messengers") and responds to this information by creating hormones, which it then sends to the **pituitary gland**, which hangs from the hypothalamus. The pituitary gland either responds to or sends these hormones to the body's organs.

Two hormones that the hypothalamus makes and sends to the posterior pituitary gland are **oxytocin** and **antidiuretic hormone (ADH)**.

# Anatomy of the Endocrine System

The diagram illustrates the human endocrine system, showing the location of major glands and their hormonal functions. The glands are labeled as follows:

- Hypothalamus:** Located in the brain, it controls the pituitary gland and releases/receives hormones.
- Pituitary Gland:** Located below the hypothalamus, it releases/receives hormones that control other glands.
- Thyroid Gland:** Located in the neck, it releases/receives hormones that regulate metabolism.
- Parathyroid Glands:** Four small glands located on the thyroid gland, they release/receive hormones that regulate calcium levels.
- Adrenal Glands:** Two glands, each sitting on top of a kidney. The outer layer (cortex) releases/receives hormones that regulate salt and sugar balance, and the inner part (medulla) releases/receives hormones that regulate blood pressure.
- Testes/Ovaries:** Two glands, one in each sex, that release/receive hormones that regulate sex characteristics and reproduction.

The diagram also includes a section for the **Endocrine System** with the following information:

**Function:** The endocrine system is responsible for the release of hormones into the bloodstream, which then travel to target organs to regulate their function.

**Major Glands:**

- Hypothalamus
- Pituitary Gland
- Thyroid Gland
- Parathyroid Glands
- Adrenal Glands
- Testes/Ovaries

**Hormones:**

- Insulin
- Glucagon
- Thyroxine
- Parathyroid Hormone
- Adrenaline
- Testosterone
- Estrogen

**Diagram:** A diagram of the human endocrine system showing the location of the major glands and the flow of hormones.

**Labels:**

- Hypothalamus
- Pituitary Gland
- Thyroid Gland
- Parathyroid Glands
- Adrenal Glands
- Testes/Ovaries

**Questions:**

- What is the function of the hypothalamus?
- What is the function of the pituitary gland?
- What is the function of the thyroid gland?
- What is the function of the parathyroid glands?
- What is the function of the adrenal glands?
- What is the function of the testes/ovaries?

**Answers:**

- The hypothalamus is responsible for the release of hormones into the bloodstream, which then travel to target organs to regulate their function.
- The pituitary gland is responsible for the release of hormones that control other glands.
- The thyroid gland is responsible for the release of hormones that regulate metabolism.
- The parathyroid glands are responsible for the release of hormones that regulate calcium levels.
- The adrenal glands are responsible for the release of hormones that regulate blood pressure.
- The testes/ovaries are responsible for the release of hormones that regulate sex characteristics and reproduction.

**Conclusion:** The endocrine system is a complex system that plays a vital role in regulating the body's functions. It is essential for maintaining homeostasis and overall health.
