Energy Storage J Jensen:

Energy Storage Robert A. Huggins, 2010-09-01 Introduction Energy is necessary for a number of reasons the most basic and obvious involve the preparation of food and the provision of heat to make life comfortable or at least bearable Subsequently a wide range of technological uses of energy have emerged and been developed so that the availability of energy has become a central issue in society The easiest way to acquire useful energy is to simply find it as wood or a hydrocarbon fossil fuel in nature But it has often been found to be advantageous to convert what is simply available in nature into more useful forms and the processing and conversion of raw materials especially petrochemicals have become a very large industry Wood has been used to provide heat for a great many years In some cases it can be acquired as needed by foraging or cutting followed by simple collection When it is abundant there is relatively little need for it to be stored However many societies have found it desirable to collect more wood than is immediately needed during warm periods during the year and to store it up for use in the winter when the needs are greater or its collection is not so convenient One can still see this in some locations such as the more remote communities in the Alps for example One might think of this as the oldest and simplest example of energy storage

Solar Thermal Energy Storage H.P. Garg, S.C. Mullick, Vijay K. Bhargava, 2012-12-06 Energy Storage not only plays an important role in conserving the energy but also improves the performance and reliability of a wide range of energy systems Energy storage leads to saving of premium fuels and makes the system more cost effective by

reducing the wastage of energy In most systems there is a mismatch between the energy supply and energy demand The energy storage can even out this imbalance and thereby help in savings of capital costs Energy storage is all the more important where the energy source is intermittent such as Solar Energy The use of intermittent energy sources is likely to grow If more and more solar energy is to be used for domestic and industrial applications then energy storage is very crucial If no storage is used in solar energy systems then the major part of the energy demand will be met by the back up or auxiliary energy and therefore the so called annual solar load fraction will be very low In case of solar energy both short term and long term energy storage systems can be used which can adjust the phase difference between solar energy supply and energy demand and can match seasonal demands to the solar availability respectively Thermal energy storage can lead to capital cost savings fuel savings and fuel substitution in many application areas Developing an optimum thermal storage system is as important an area of research as developing an alternative source of energy
