Energy Return on Investment Charles A.S. Hall, 2016-11-29 This authoritative but highly accessible book presents the reader with a powerful framework for understanding the critical role of the energy return on investment EROI in the survival and well being of individuals ecosystems businesses economies and nations Growth and development are fundamental and ubiquitous processes at all scales from individuals to food crops to national economies While we are all familiar with the concepts of economic growth and living standards as measured by gross domestic product GDP we often take for granted the energy use that underpins GDP and our expectations for year on year growth In this book you will learn how these measures of progress are completely dependent on the balance that can be achieved between energy costs inputs and gains Nothing is made or moved without an energy surplus and it is the EROI of available energy sources more than any other single factor that determines the shape of civilization Nearly all politics and economics assume that policy and market forces are the levers upon which future outcomes will hinge However this book presents many examples of historical and current events that can be explained much more clearly from an energetic perspective In addition a future scenario is developed that gives a central place to EROI in assessing the potential of governmental and private initiatives to substitute so called renewable energy sources for diminishing stocks of fossil fuels When cheap fossil fuels are no longer available in the abundance needed to mask economic

problems and power business as usual it will be EROI more than the plethora of green technologies that creates the boundary conditions for a sustainable future

Energy and the Wealth of Nations Charles A.S. Hall, Kent Klitgaard, 2018-03-05 In this updated edition of a groundbreaking text concepts such as energy return on investment EROI provide powerful insights into the real balance sheets that drive our petroleum economy Hall and Klitgaard explore the relation between energy and the wealth explosion of the 20th century and the interaction of internal limits to growth found in the investment process and rising inequality with the biophysical limits posed by finite energy resources The authors focus attention on the failure of markets to recognize or efficiently allocate diminishing resources the economic consequences of peak oil the high cost and relatively low EROI of finding and exploiting new oil fields including the much ballyhooed shale plays and oil sands and whether alternative energy technologies such as wind and solar power can meet the minimum EROI requirements needed to run society as we know it For the past 150 years economics has been treated as a social science in which economies are modeled as a circular flow of income between producers and consumers In this perpetual motion of interactions between firms that produce and households that consume little or no accounting is given of the flow of energy and materials from the environment and back again In the standard economic model energy and matter are completely recycled in these transactions and economic activity is seemingly exempt from the Second Law of Thermodynamics As we enter the second half of the age of oil when energy supplies and the environmental impacts of energy production and consumption are likely to constrain economic growth this exemption should be considered illusory at best This book is an essential read for all scientists and economists who have recognized the urgent need for a more scientific empirical and unified approach to economics in an energy constrained world and serves as an ideal teaching text for the growing number of courses such as the authors own on the role of energy in society

Agriculture and the Environment C.A. Edwards, M.K. Wali, D.J. Horn, F. Miller, 2012-12-02 Until the 1980s global increases in food production exceeded the concomitant growth of human populations However progressively agriculture is becoming unable to meet the world wide per capita needs for food Unless there is major international cooperation in addressing the problems associated with population control it is predicted that the global human population will reach more than 14 billion by the year 2050 with provision of adequate food fuel and space for such an increased population unachievable These problems are accentuated by factors such as world wide reductions in soil fertility the accelerating degradation of land that is suitable for food production through soil erosion the world wide trend for migration of human populations from rural habitats to cities and extremely rapid rates of global deforestation Possible solutions to global sustainability in agriculture and natural resources must involve an integration of ecological sociological cultural and economic considerations as well as mandated international and national policies This publication outlines these problems and attempts to seek solutions
