

## Zero System Pressure Fault

A zero system pressure fault occurs when a component fails in such a way that flow from the pump stops or resistance to the flow stops. A no-resistance condition can occur when a component opens a free-flow pathway to the reservoir.

Several components in a system can cause a zero system pressure fault. The most common are pumps, relief valves, and directional control valves.

## Cushion Adjustment Procedure (Cont.)

As you cycle the cylinder to measure its stroke times, also observe the amount of shock incurred when the cylinder piston reaches its end of travel in each direction.

Turning the cushion screws clockwise increases the deceleration time, and therefore increases the cushioning effect. Turning the screws counterclockwise decreases deceleration time, lessening the cushion effect.

Adjust the cushion screws so the cylinder decelerates smoothly to a stopped condition.
