**Initiation and Control of Gait from First Principles: A Mathematically Animated Model of the Foot** Craig Nevin, 2010-05-21 This thesis examines the anatomical locations of the

dynamic pressures that create the first five footprints when a standing person starts to walk It is hypothesized that the primary activity starts with the dorsiflexion or lifting of the great toe Consequently the metatarsophalangeal region of the forefoot was studied from three directions Viewed side on the great toe free body is found from a detailed post hoc analysis of previous kinematic data obtained from cadavers to operate as a cam The cam model also follows closely from Aristotle's ancient description of the hinged instrument of animate motion Viewed in coronal cross section the first metatarsal torsion strength was estimated in 13 humans 1 gorilla 3 chimpanzees 1 orangutan and 1 baboon set of dry bone specimens of the hands and feet The first metatarsal bone alone contributes 43% of the total strength of all the metatarsal bones A result unique amongst the hominids and apes studied Viewed in horizontal plan the dynamic components and principle axes of the footprints of 54 barefoot humans 32 male 22 female age 32 11 years were studied whilst standing on a 0.5m pressure plate and then immediately when walking over a 2m plate 4 sensors per cm<sup>2</sup> sampled at 100hz Two footprints were obtained during the initial stance posture and the first three footprints of the initial walk Three new principles of animate motion were deduced from the divergent results obtained from complete and dissected cadavers The metatarsal cam from the sagittal side view the ground reaction torque from the frontal coronal view and the amputation artifact The philosophy of experimenting on inanimate cadavers rather than living subjects was intensively researched Instead of assuming that gait is a uniform or regular motion as is usual the foot was analyzed rather as if it was a beam attached to the ground Engineering equations were used to determine the flexural properties of the foot every 0.01 seconds including the principle axes radius of gyration and the local shear stresses on the sensors spaced 5.7mm apart A sequence of these impressions creates a mathematically animated model of the footprint The local force under the foot was normalized against both the total force and contact duration The forces under the foot were each divided between 10 anatomical regions using individual masks for each foot strike Producing a 54 subject database from which the normal behavior of the foot could be quantified The group showed a surprisingly low right foot step off dominance of only 54% The combination of the radius of gyration and impulse in particular produces a succinct but powerful summary of the footprint during dynamic activity The initial angle and magnitudes of the loads that are applied and removed demonstrates that the body first rocks onto the heels after the instruction to walk is given The feet simultaneously invert and their arches rise off the ground as anticipated The principle axes were then animated in a mathematical four dimensional model The horizontal radius of gyration is on average 5 cm during heel strike but increases to 20 cm as the forefoot comes into contact with the ground finally rising to 25 cm at toe off Significantly the applied load during the fore foot loading phase is more widely distributed than the load being removed A new and unanticipated result that is believed to be a special characteristic of the animate foot The standard deviation of the force under the great toe is the first mechanical parameter to converge in the 54 subjects conclusively verifying the hypothesis that the great toe both initiates and controls gait

**Introduction to Machine Dynamics** Mehrdaad Ghorashi, 2025-09-26 This book introduces

machine dynamics an essential competency important for many applications such as designing robots for manufacturing materials handling or the landing gear of an airplane analyzing the motion of a piston in an internal combustion engine or a compressor and designing a Mars Rover Wherever a machine is used for force or power transmission or a mechanism creates a desired motion the methods studied in this book provide the fundamental knowledge needed for optimal design Specific sections are provided on different types of mechanisms and conditions that should be met for obtaining a desired performance including kinematic analysis of mechanisms using direct differentiation relative motion kinematic coefficients and instantaneous centers The Newton Raphson method for solving complex nonlinear position analysis problems is discussed and the determination of dead and limit positions in mechanisms is presented The relation between the angular velocity ratio theorem and the fundamental law of gearing is shown to provide a bridge between the concept of instantaneous centers and analyzing gears Gears and gear trains are covered in detail and calculation of gear ratios in fixed axis and planetary gear trains using the rolling contact equations is illustrated Finally power and force transmission in machines is covered Static and dynamic cases are analyzed and the author shows how the static solutions can provide approximations for the dynamic problems where inertia effects are not significant low inertia and low accelerations Application of matrix algebra for solving the system of equations of equilibrium in statics or equations of motion in dynamics is also illustrated Because of the importance of balancing in any application involving rotating machinery static and dynamic balancing are analyzed The book concludes with a brief coverage of three dimensional dynamics including Euler s equations and gyroscopic effect Aimed at engineering students interested in machine dynamics across a range of disciplines the book is also ideal as a reference for practicing engineers with a good understanding of statics dynamics and matrix algebra

**Solving Statics Problems with MathCAD** Brian D. Harper,J. L. Meriam,L. G. Kraige,2001-09-11 Over the past 50 years Meriam Kraige s Engineering Mechanics Statics has established a highly respected tradition of Excellence A Tradition that emphasizes accuracy rigor clarity and applications Now completely revised redesigned and modernized the fifth edition of this classic text builds on these strengths adding new problems and a more accessible student friendly presentation Solving Statics Problems with MathCAD If MathCAD is the computer algebra system you need to use for your engineering calculations and graphical output this reference will be a valuable tutorial for your studies Written as a guidebook for students in the Engineering Statics class it will help you with your engineering assignments throughout the course
