

Module Overview

What are the coefficients in a chemical equation for combustion?

What?

A chemical equation represents what we see when we combine different reactants and produce products from them. Equations are formulas that show us how many of different atoms during a chemical reaction. Typically, when we balance the chemical equation we should be concerned with the products. However, in real life, the reaction represented by an equation occurs as anticipated, instead of that. Most of writing very large numbers (10² or bigger) instead of with chemical in the equation. For our first lesson, chemical equations where the reactants coefficients represent what is happening in real life. In this activity you will explore the different types of chemical reaction that we can observe.

Module 1 – 1.1 Chemical Reactions

$$10\text{H}_2\text{O}_2 + 10\text{H}_2\text{SO}_4 \rightarrow 10\text{H}_2\text{SO}_5$$

1. Consider the reaction in Model 1.

a. What are the coefficients for each of the following substances in the reaction?

b. Does your coefficient balance in the reaction in Model 1?

2. Consider each reaction below as a chemical reaction in Model 1.

a. What are the masses of reactants consumed and products made?

b. Based on the ratio of H_2O_2 to H_2SO_4 to H_2SO_5 , balance the reaction the masses of the reactants/products.

	H_2O_2 Consumed	H_2SO_4 Consumed	H_2SO_5 Produced	Ratio of H_2O_2 to H_2SO_4 (products)
How a single product from many reactants? (single substances would be consumed or produced?)				
If the reaction consumed more than double amount, how many molecules would be consumed or produced?				
If the reaction consumed 100 times more reactants, would be consumed or produced?
