The endocrine system is a network of glands that produce and release hormones. Hormones are chemical substances that help control many important body functions, including the body's ability to change calories into energy that powers cells and organs.

The endocrine system influences how your heart beats, how your bones and tissues grow, even your ability to make a baby. It plays a vital role in whether or not you develop diabetes, thyroid disease, growth disorders, sexual dysfunction, and a host of other hormone-related disorders.

The endocrine system works in concert with the nervous system to regulate body activities. The nervous system acts through electrical impulses and neurotransmitters to cause muscle contraction and glandular secretion.

There are **100** types of glands in the endocrine system.

Exocrine glands	Endocrine glands
take their secretions to the surface through ducts that exit the body (e.g., mammary, sebaceous, sweat, and glands that secrete digestive enzymes)	The seven sets of gland secrete different hormones directly into the blood (they do not have ducts that carry their secretions to the surface and out of the body); the endocrine hormones are carried throughout the body where they influence cells that have receptor sites for that particular hormone

Major Endocrine Glands

Male Female

Pituitary gland - located at the bottom or base of the brain; master gland; secretes hormones that control all other glands, and hormones that regulate growth. For example, the pituitary gland produces **prolactin**, which acts on the breasts to induce milk production. The pituitary gland also secretes hormones that act on the **adrenal glands**, **thyroid gland**, **ovaries** and **testes**, which in turn produce other hormones. Through secretion of its hormones, the pituitary gland controls **metabolism**, growth, sexual
