QUESTION A 60-year-old man with a 20-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports that he has been unable to tolerate his usual diet and has lost approximately 10 kg (22 lb) in the last 3 months. He has no recent changes in his medications. His medical history is significant for hypertension, hyperlipidemia, and chronic kidney disease (CKD). He is currently on insulin glargine and insulin lispro. His last hemoglobin A1c was 8.5%. He has no family history of diabetes mellitus. On physical examination, he is thin and appears to be in distress. His vital signs are stable. His physical examination is unremarkable except for mild weight loss and decreased muscle mass. Laboratory studies show a hemoglobin A1c of 9.5%, serum glucose of 180 mg/dL, serum insulin of 0.5 µU/mL, and serum C-peptide of 0.1 ng/mL. His renal function is stable with a serum creatinine of 1.2 mg/dL and an estimated glomerular filtration rate (eGFR) of 30 mL/min/1.73 m². His lipid profile is within normal limits. The patient is concerned about the possibility of a new diagnosis of type 1 diabetes mellitus. What is the most likely cause of his symptoms?

ANSWER B. Insulin deficiency

EXPLANATION The patient's symptoms and laboratory findings are consistent with a new diagnosis of type 1 diabetes mellitus. The most likely cause of his symptoms is insulin deficiency. The patient's weight loss, decreased appetite, and fatigue are classic symptoms of uncontrolled diabetes. The laboratory studies show a significantly elevated hemoglobin A1c (9.5%) and serum glucose (180 mg/dL), which is consistent with hyperglycemia. The serum insulin level (0.5 µU/mL) and C-peptide level (0.1 ng/mL) are both low, indicating a severe deficiency of endogenous insulin. The patient's renal function is stable, and his lipid profile is within normal limits, which makes other causes of his symptoms less likely. The patient's history of type 2 diabetes mellitus and chronic kidney disease does not explain the acute onset of his symptoms. The patient's concern about a new diagnosis of type 1 diabetes mellitus is valid, as the symptoms and laboratory findings are consistent with this condition. The most likely cause of his symptoms is insulin deficiency.

The image shows a document page with a large black redaction box covering the majority of the content. The redaction box is rectangular and spans most of the page width and height. The text is mostly illegible due to the redaction, but some fragments are visible at the top and bottom. At the top, there is a header section with some text that is partially obscured. Below the redaction box, there is a footer section with some text, including what appears to be a date and a page number. The overall appearance is that of a scanned document where the main body of text has been completely redacted.

A vertical strip of a document page, likely a checklist or form. It features a column of checkboxes on the left, some of which are marked with 'X'. To the right of the checkboxes is a column of text, which appears to be a list of items or tasks. Some of the text is handwritten, while some is printed. The document is oriented vertically, and the strip shows a portion of the page, with the top and bottom edges visible.

QUESTION A 60-year-old male with a long history of alcohol abuse presents with a 2-week history of increasing weakness and weight loss. He reports a recent episode of vomiting blood. Physical examination reveals a pale, thin man with a 10-lb weight loss over the past 3 months. Laboratory studies show a hemoglobin of 8 g/dL, hematocrit of 24%, and platelet count of 150,000/mm³. Endoscopy reveals a large, ulcerated, friable mass in the gastric antrum. Biopsy of the mass shows malignant cells. Which of the following is the most likely histologic type of this tumor?

ANSWER D. Adenocarcinoma

EXPLANATION: The patient's history of alcohol abuse, weight loss, and vomiting blood, along with the endoscopic findings of a large, ulcerated, friable mass in the gastric antrum, are highly suggestive of gastric adenocarcinoma. Gastric adenocarcinoma is the most common type of gastric cancer, accounting for approximately 90% of all gastric malignancies. It typically arises from the gastric mucosa and can present as a polypoid, ulcerated, or infiltrative mass. The histologic findings of malignant cells are consistent with adenocarcinoma. Other types of gastric cancer, such as lymphoma or sarcoma, are much less common and typically have different clinical and histologic features. The patient's long history of alcohol abuse is a risk factor for gastric cancer, particularly for the adenocarcinoma subtype.

1 **QUESTION**

2 The following table shows the number of people who attended the 2008 Summer Olympic Games in Beijing, China, and the 2012 Summer Olympic Games in London, England. The number of people who attended the 2008 Summer Olympic Games in Beijing, China, was 1.1 million more than the number of people who attended the 2012 Summer Olympic Games in London, England. How many people attended the 2008 Summer Olympic Games in Beijing, China?
