Dudley** Evarist Giné,Vladimir Koltchinskii,R. Norvaiša,2010-08-13 For almost fifty years Richard M Dudley has been extremely influential in the development of several areas of Probability His work on Gaussian processes led to the understanding of the basic fact that their sample boundedness and continuity should be characterized in terms of proper measures of complexity of their parameter spaces equipped with the intrinsic covariance metric His sufficient condition for sample continuity in terms of metric entropy is widely used and was proved by X Fernique to be necessary for stationary Gaussian processes whereas its more subtle versions majorizing measures were proved by M Talagrand to be necessary in general Together with V N Vapnik and A Y Cervonenkis R M Dudley is a founder of the modern theory of empirical processes in general spaces His work on uniform central limit theorems under bracketing entropy conditions and for Vapnik Cervonenkis classes greatly extends classical results that go back to A N Kolmogorov and M D Donsker and became the starting point of a new line of research continued in the work of Dudley and others that developed empirical processes into one of the major tools in mathematical statistics and statistical learning theory As a consequence of Dudley s early work on weak convergence of probability measures on non separable metric spaces the Skorohod topology on the space of regulated right continuous functions can be replaced in the study of weak convergence of the empirical distribution function by the supremum norm In a further recent step Dudley replaces this norm by the stronger  $p$  variation norms which then allows replacing compact differentiability of many statistical functionals by Frchet differentiability in the delta method Richard M Dudley has also made important contributions to mathematical statistics the theory of weak convergence relativistic Markov processes differentiability of nonlinear operators and several other areas of mathematics Professor Dudley has been the adviser to thirty PhD s and is a Professor of Mathematics at the Massachusetts Institute of Technology Resources in Education ,1994 Whitaker's Five-year Cumulative Book List ,1968 *The Measurement of Association* Kenneth J. Berry,Janis E. Johnston,Paul W. Mielke, Jr.,2018-11-02 This research monograph utilizes exact and Monte Carlo permutation statistical methods to generate probability values and measures of effect size for a variety of measures of association Association is broadly defined to include measures of correlation for two interval level variables measures of association for two nominal level variables or two ordinal level variables and measures of agreement for two nominal level or two ordinal level variables Additionally measures of association for mixtures of the three levels of measurement are considered nominal ordinal nominal interval and ordinal interval measures Numerous

comparisons of permutation and classical statistical methods are presented Unlike classical statistical methods permutation statistical methods do not rely on theoretical distributions avoid the usual assumptions of normality and homogeneity of variance and depend only on the data at hand This book takes a unique approach to explaining statistics by integrating a large variety of statistical methods and establishing the rigor of a topic that to many may seem to be a nascent field This topic is relatively new in that it took modern computing power to make permutation methods available to those working in mainstream research Written for a statistically informed audience it is particularly useful for teachers of statistics practicing statisticians applied statisticians and quantitative graduate students in fields such as psychology medical research epidemiology public health and biology It can also serve as a textbook in graduate courses in subjects like statistics psychology and biology
