Enhancing Air Traffic Management Anastasia

Lemetti, 2025-04-28 Air Traffic Management ATM faces significant challenges in ensuring efficiency safety and sustainability Among these weather conditions and Air Traffic Controller ATCO workload play crucial roles in overall system performance Adverse weather frequently disrupts operations leading to inefficient flight trajectories increased fuel consumption and environmental impact It also elevates ATCO workload thereby complicating ATCOs ability to maintain safe and efficient air traffic flow This thesis explores data driven and analytical approaches to address these challenges focusing on the impact of weather on flight efficiency airspace capacity and ATCO scheduling in remote tower centers Additionally it examines ATCO workload prediction using behavioral and physiological data The study covers applications in airspace capacity management staff scheduling and ATCO workload assessment The thesis examines historical flight and weather data from Stockholm Arlanda and Gothenburg Landvetter airports over a two year period 2019 2020 revealing persistent inefficiencies in arrival operations despite the overall reduction in traffic during the COVID 19 pandemic It presents a methodology grounded in statistical analysis to identify the key factors influencing arrival performance with particular emphasis on the impact of adverse weather conditions and traffic intensity The proposed approach systematically determines the most influential variables affecting arrival performance in both the horizontal and vertical flight dimensions Adverse weather conditions such as convective weather can lead to restrictions on aircraft movements reduce available routes and necessitate adjustments in ATM strategies As a result understanding and predicting weather related impacts on airspace capacity is essential for optimizing air traffic flow and minimizing delays In this thesis we develop a methodology based on the continuous maxflow mincut theory to estimate reductions in Air Traffic Control ATC sector capacity due to predicted convective weather activity The uncertainty in meteorological forecasts is quantified using Ensemble Weather Forecasting We demonstrate the application of this methodology for assessing congestion in ATC sectors using a realistic sector and a full sector configuration as examples Additionally we introduce a probabilistic framework for presenting congestion status aimed at supporting decision making processes at the Flow Management Position The thesis presents probabilistic models that incorporate the impact of adverse weather conditions into a Mixed Integer Linear Programming framework for ATCO shift scheduling in remote and conventional towers Building on previous project developments these models specifically address the influence of weather on ATCO operations in remote towers Probabilistic weather products are used to generate ensembles of staffing solutions enabling the derivation of probability distributions for the required number of ATCOs The modeling approach leverages recently developed techniques to tackle challenges associated with weather uncertainty The proposed solutions are validated using historical flight and weather data from five Swedish airports designated for future remote operation The final part of this thesis focuses on developing unobtrusive methods for predicting ATCO workload by exploring the feasibility of

non intrusive data collection techniques combined with machine learning algorithms Eye tracking data previously identified as a promising indicator of ATCO workload were collected from controllers in simulated environments and used as predictive features Subjective workload assessments based on self reported Cooper Harper scale ratings serve as label variables Multiple machine learning models are evaluated for workload prediction and feature selection techniques are applied to identify a minimal yet effective set of eye tracking features This approach provides a seamless non intrusive means of continuously assessing workload making it a valuable tool for both research and operational applications in ATC environments By addressing critical challenges in ATM this thesis contributes to a safer more efficient and environmentally sustainable air transport system The findings of this thesis have significant implications for the future of ATM particularly in an era of increasing air traffic demand and evolving weather challenges The integration of data driven techniques optimization and probabilistic modeling offers a powerful framework for improving decision making in ATM The methodologies proposed in this thesis can serve as a foundation for future research and industry applications enabling continuous improvements in ATM performance and resilience against external disruptions
