Gribok, Joonki Paik, 2016-12-06 This book presents practical optimization techniques used in image processing and computer vision problems Ill posed problems are introduced and used as examples to show how each type of problem is related to typical image processing and computer vision problems Unconstrained optimization gives the best solution based on numerical minimization of a single scalar valued objective function or cost function Unconstrained optimization problems have been intensively studied and many algorithms and tools have been developed to solve them Most practical optimization problems however arise with a set of constraints Typical examples of constraints include i pre specified pixel intensity range ii smoothness or correlation with neighboring information iii existence on a certain contour of lines or curves and iv given statistical or spectral characteristics of the solution Regularized optimization is a special method used to solve a class of constrained optimization problems The term regularization refers to the transformation of an objective function with constraints into a different objective function automatically reflecting constraints in the unconstrained minimization process Because of its simplicity and efficiency regularized optimization has many application areas such as image restoration image reconstruction optical flow estimation etc Optimization plays a major role in a wide variety of theories for image processing and computer vision Various optimization techniques are used at different levels for these problems and this volume summarizes and explains these techniques as applied to image processing and computer vision **High Speed Rail**
