## Do we really drink the same water that dinosaurs did?

When water vapor is transported to cooler regions—either away from the tropics or higher up into the atmosphere—it cools. As water vapor cools, it gives up its heat energy and changes back into a liquid. We call this process **condensation**. In the atmosphere, condensation takes the form of tiny droplets of water. We see condensation as clouds in the sky or fog near the ground.

When water droplets get so big that air currents can no longer support them, they fall to Earth's surface as rain. This rainfall is called **precipitation**. If the air is cold enough, condensation of water vapor makes form. Snow is another form of

## Do we really drink the same water that dinosaurs did?

The movement of water between the ocean, air, and land is powered by the sun. Energy from the sun heats liquid water and causes it to **evaporate**, or change into an invisible gas called **water vapor**. Water vapor enters the atmosphere, where it mixes with other gases. We describe the amount of water vapor in the air in terms of **humidity**. When there is more moisture in the air, the humidity is higher.

Most of the evaporation on Earth is from oceans close to the equator, where heating by the sun is greatest. Warm, humid air from the equator
