

DNA

Deoxyribonucleic acid, commonly known as DNA, is a molecule that carries the genetic instructions used in the growth, development, functioning, and reproduction of all known living organisms.

Structure

DNA is composed of two long chains of nucleotides twisted into a double helix. Each nucleotide consists of a sugar molecule, a phosphate group, and a nitrogenous base.

Function

The primary function of DNA is to store and transmit genetic information. It encodes the instructions necessary for the development and functioning of an organism.

Replication

DNA replication is the process by which DNA makes an identical copy of itself. It ensures that each daughter cell receives a complete set of chromosomes during cell division.

Transcription

Transcription is the process of synthesizing an RNA molecule from a DNA template. It plays a crucial role in protein synthesis by producing messenger RNA (mRNA).

Translation

Translation is the process by which the information in mRNA is used to synthesize proteins. It occurs at the ribosomes and involves the conversion of mRNA sequences into amino acid sequences.

Mutations

Mutations are changes in the DNA sequence that can lead to genetic variations. They can be caused by errors during DNA replication or exposure to mutagens.

Genetic Code

The genetic code is the set of rules by which information encoded in DNA and mRNA is translated into proteins. It determines the amino acid sequence in a protein.

DNA Technology

DNA technology encompasses a range of techniques used to study and manipulate DNA. It has applications in various fields, including medicine, agriculture, and forensic science.

DNA Sequencing

DNA sequencing is the process of determining the precise order of nucleotides in a DNA molecule. It has revolutionized genetics and has important applications in personalized medicine and genetic research.
