The book cover features a photograph of a highway at night. In the foreground, there are several toll booths with signs that read "EXACT CHANGE" and "CARS ONLY". Long, vibrant red and white light trails from cars are visible on the road, creating a sense of motion. In the background, a city skyline with illuminated buildings is visible under a dark blue night sky.

Mathematics for Dynamic Modeling Edward Beltrami, 2014-05-10 Mathematics for Dynamic Modeling provides an introduction to the mathematics of dynamical systems This book presents the mathematical formulations in terms of linear and nonlinear differential equations Organized into two parts encompassing nine chapters this book begins with an overview of the notions of equilibrium and stability in differential equation modeling that occur in the guise of simple models in the plane This text then focuses on nonlinear models in which the limiting behavior of orbits can be more complicated Other chapters consider the problems that illustrate the concepts of equilibrium and stability limit cycles chaos and bifurcation This book discusses as well a variety of topics including cusp catastrophes strange attractors and reaction diffusion and shock phenomena The final chapter deals with models that are based on the notion of optimization This book is intended to be suitable for students in upper undergraduate and first year graduate course in mathematical modeling

Mathematics for Dynamic Modeling Edward J. Beltrami, 1987 This new edition of Mathematics for Dynamic covers tools such as linearization feedback concepts the use of Liapunov functions and optimal control Each chapter includes exercises many of which expand on the material in the text

Dynamic Modeling of Diseases and Pests Bruce Hannon, Matthias Ruth, 2008-10-16 The ease of use of the programs in the application to ever more complex cases of disease and pestilence The lack of need on the part of the student or modelers of mathematics beyond algebra and the lack of need of any prior computer programming experience The surprising insights that can be gained from initially simple systems models

Modeling Dynamic Biological Systems Bruce Hannon, Matthias Ruth, 2012-12-06 Models help us understand the dynamics of real world processes by using the computer to mimic the actual forces that are known or assumed to result in a system's behavior This book does not require a substantial background in mathematics or computer science

The Art of Modeling Dynamic Systems Foster Morrison, 2012-03-07 This text illustrates the roles of statistical methods coordinate

transformations and mathematical analysis in mapping complex unpredictable dynamical systems It describes the benefits and limitations of the available modeling tools showing engineers and scientists how any system can be rendered simpler and more predictable Written by a well known authority in the field this volume employs practical examples and analogies to make models more meaningful The more universal methods appear in considerable detail and advanced dynamic principles feature easy to understand examples The text draws careful distinctions between mathematical abstractions and observable realities Additional topics include the role of pure mathematics the limitations of numerical methods forecasting in the presence of chaos and randomness and dynamics without calculus Specialized techniques and case histories are coordinated with a carefully selected and annotated bibliography The original edition was a Library of Science Main Selection in May 1991 This new Dover edition features corrections by the author and a new Preface

Dynamic Modeling for Marine Conservation Matthias Ruth, James Lindholm, 2012-12-06 The effects of disturbed ecosystems from devastating algal blooms to the loss of whale populations have demonstrated the vulnerability of the oceans biodiversity This book provides methods for learning how ocean systems function how natural and human actions put them in peril and how we can influence the marine world in order to maintain biodiversity The difficulties of research in the oceans make computer modeling particularly helpful for marine conservation The authors demonstrate dynamic modeling through the use of the STELLA modeling program and case studies from marine conservation

An Invitation to Biomathematics Raina Robeva, James R. Kirkwood, Robin Lee Davies, Leon Farhy, Boris Kovatchev, Martin Straume, Michael L. Johnson, 2007-08-28 Essential for all biology and biomathematics courses this textbook provides students with a fresh perspective of quantitative techniques in biology in a field where virtually any advance in the life sciences requires a sophisticated mathematical approach An Invitation to Biomathematics expertly written by a team of experienced educators offers students a solid understanding of solving biological problems with mathematical applications This text succeeds in enabling students to truly experience advancements made in biology through mathematical models by containing computer based hands on laboratory projects with emphasis on model development model validation and model refinement The supplementary work Laboratory Manual of Biomathematics is available separately ISBN 0123740223 or as a set ISBN 0123740290 Provides a complete guide for development of quantification skills crucial for applying mathematical methods to biological problems Includes well known examples from across disciplines in the life sciences including modern biomedical research Explains how to use data sets or dynamical processes to build mathematical models Offers extensive illustrative materials Written in clear and easy to follow language without assuming a background in math or biology A laboratory manual is available for hands on computer assisted projects based on material covered in the text

Chaos A.A. Tsonis, 2012-12-06 Based on chaos theory two very important points are clear 1 random looking aperiodic behavior may be the product of determinism and 2 nonlinear problems should be treated as nonlinear problems and not as simplified linear problems The theoretical aspects of chaos have been presented in

great detail in several excellent books published in the last five years or so. However, while the problems associated with applications of the theory such as dimension and Lyapunov exponent estimation, chaos and nonlinear prediction and noise reduction have been discussed in workshops and articles, they have not been presented in book form. This book has been prepared to fill this gap between theory and applications and to assist students and scientists wishing to apply ideas from the theory of nonlinear dynamical systems to problems from their areas of interest. The book is intended to be used as a text for an upper level undergraduate or graduate level course as well as a reference source for researchers. My philosophy behind writing this book was to keep it simple and informative without compromising accuracy. I have made an effort to present the concepts by using simple systems and step by step derivations. Anyone with an understanding of basic differential equations and matrix theory should follow the text without difficulty. The book was designed to be self contained. When applicable examples accompany the theory. The reader will notice however that in the later chapters specific examples become less frequent. This is purposely done in the hope that individuals will draw on their own ideas and research projects for examples.
