Chapter 5: Computer Systems Organization

Solutions to End-of-Chapter Exercises

1. The advantage of using a very large memory cell size is that the computer can store larger (in terms of absolute value) values in its memory cells. The disadvantage is that there would be fewer cells available, and with such big cells there would be a lot of wasted space when storing small numbers. The largest positive integer that could be stored in a system using sign/magnitude notation, with 64-bit cells is 2^{63} . If two such cells were used to store integers, the largest integer that could be stored by the system is 2^{127} .
2. a. 20 bits ($2^{20} = 1,048,576$, just over one million)
 b. 24 bits
 c. 27 bits
 d. 30 bits
3. A memory unit with 640 KB has 640×2^{10} memory cells, provided that the computer uses 8-bit cells. A memory unit with 512 MB would contain 512×2^{20} memory cells. A memory unit with 2 GB would contain 2×2^{30} cells.
4. Read-only memory can be used to store essential system instructions that users cannot overwrite. The information could originally be stored in the ROM by hardwiring the electronic circuitry.
