

Gable End Frame Permanent Bracing Arriostre Permanente de Armazones Hastiales

Application – Aplicación

Most manufactured gable end frames contain only flat vertical "studs" (as opposed to triangulated web members) and are designed to transfer roof loads (i.e., gravity and/or uplift) acting vertically in the plane of the frame directly into a continuous structural bearing below. Any web member reinforcement, shown on the Truss Design Drawing (TDD) for the gable end frame, is required to prevent column buckling of the web members due to the vertical loads applied to the frame.

La mayoría de armazones hastiales fabricados contienen solamente montantes planos y verticales (a diferencia de las viguetas triangulares) y están diseñados para transferir cargas de techo (p. ej.: gravedad o elevación) directamente a un soporte continuo inferior actuando verticalmente en el plano del armazón. El refuerzo de las viguetas, como se muestra en el dibujo de diseño de la armadura (Truss Design Drawing, TDD) para el armazón hastial, es necesario para evitar que las columnas de las viguetas cedan debido a las cargas verticales aplicadas sobre el armazón.

In service, gable end frames often experience lateral loads applied parallel and perpendicular to their plane from wind and/or seismic events. Gable end frames are not designed to resist these loads but rely on properly designed and installed structural sheathing, bracing, and connections to the bearing wall, roof and ceiling diaphragms to adequately resist and transfer these lateral loads.

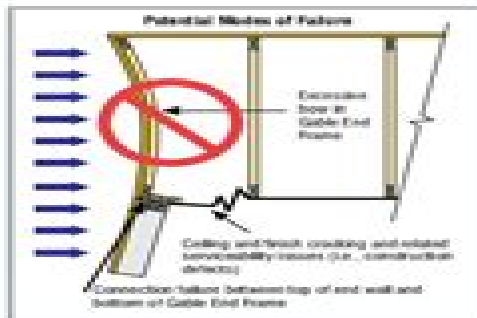

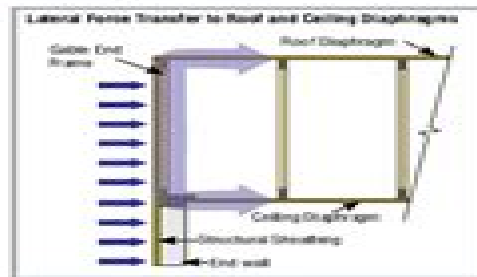

Una vez montados, los armazones hastiales a menudo soportan cargas laterales aplicadas paralela y perpendicularmente a sus planos en caso de sismo o viento. Los armazones hastiales dependen de que el enladrado estructural, el apuntalamiento y las conexiones estén correctamente diseñados e instalados en la pared de soporte y en los diafragmas de techo para resistir y transferir esas cargas laterales adecuadamente.

Design Considerations – Consideraciones de Diseño

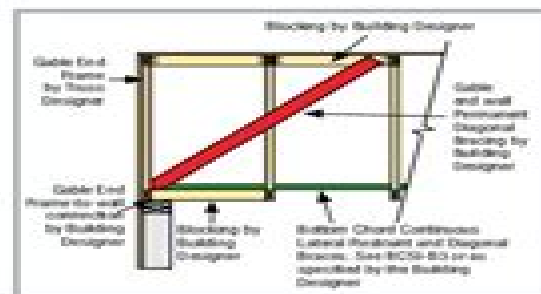

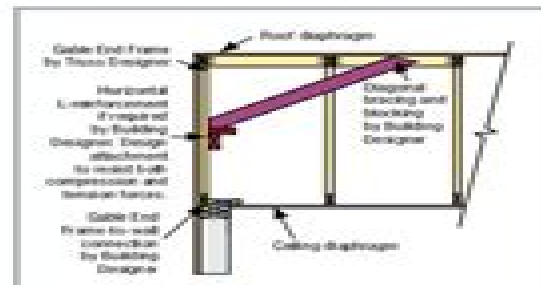

The goal of gable end frame bracing is to transfer the lateral loads applied perpendicular to the gable end frame safely into the roof and/or ceiling diaphragm(s) and the wall.

La meta es transferir de forma segura las cargas laterales aplicadas perpendicularmente al armazón hastial a la pared o a los diafragmas de techo.

Inadequate design and/or construction can lead to several possible modes of failure.

Un diseño o construcción incorrectos pueden dar lugar a fallos en la estructura.
