Florida Focus Answers Biology 2014:

Integrating Conservation Biology and Paleobiology to Manage Biodiversity and Ecosystems in a Changing World G. Lynn Wingard, Chris Schneider, Gregory P. Dietl, Damien Fordham, Policy makers and resource managers must make decisions that affect the resilience and sustainability of natural resources including biodiversity and ecosystem services. However, these decisions are often based on evidence or theory derived from highly altered systems and over short time periods of low magnitude environmental and climatic change. Because natural systems change and evolve across multiple timescales from instantaneous to millennial long term, understanding of how past life has responded to perturbations can inform resource managers. By using these natural laboratories of the past, conservation paleobiology and paleoecology provide the framework necessary to anticipate and plan for future changes. The goal of this Research Topic is to heighten awareness among conservation and restoration practitioners to the value and applications of long term perspectives provided by conservation paleobiology and paleoecology. Most conservation studies focus on systems already impacted by anthropogenic change; these studies would benefit from paleontological data through expanded temporal scales, identification of baselines, and an understanding of how organisms have responded to past changes. However, resource management decisions rarely include input from paleontologists, and paleoecological research is rarely incorporated into conservation decision making. We seek to bridge this research implementation gap by highlighting the application of paleoecological data to issues such as biodiversity dynamics, extinction risks, and resilience to perturbations among other topics. We hope to foster new cross-disciplinary synergies by encouraging conservation scientists and managers to collaborate with paleontologists to improve conservation decision making and by increasing awareness among paleontologists to the needs of the resource management community. This Research Topic will provide a forum for both the paleontological and resource management communities to exchange ideas that will enhance restoration and conservation decision making. We invite papers on conceptual advances, reviews of specific topics to guide efforts in research or practice, case studies of successful applications, articles describing datasets with applied value and perspective, papers summarizing a body of paleontological research with relevance to the resource management community. Topics can include but are not limited to: Responses of species communities and ecosystems to perturbations; Strategies to achieve the direct integration of paleobiology and paleoecology into on-ground resource management; Identifying baselines and reference conditions; Increasing the robustness of forecasting models through the incorporation of paleontological data; Identifying key species interactions and other phenomena as indicators of impending change; New methodologies, analytical tools, and/or proxies in the application of paleontological data to conservation and restoration practice. Lynn Wingard, Damien Fordham, and Greg Dietl have no conflicts of interest. Chris Schneider has a potential conflict of interest where manuscripts pertain to stakeholders in the petroleum industry as she is an independent contractor in the Alberta Oil Sands mining area. **World Ocean Assessment** Alan Simcock, 2017-04-17

This United Nations report examines the current state of knowledge of the world's oceans for policymakers and provides a reference for marine science courses

Handbook of Road Ecology Rodney van der Ree, Daniel J. Smith, Clara Grilo, 2015-06-15 Winner of the IENE Project Award 2016 This authoritative volume brings together some of the world's leading researchers, academics, practitioners, and transportation agency personnel to present the current status of the ecological sustainability of the linear infrastructure, primarily road, rail, and utility easements that dissect and fragment landscapes globally. It outlines the potential impacts, demonstrates how this infrastructure is being improved, and how broad ecological principles are applied to mitigate the impact of road networks on wildlife. Research and monitoring is an important aspect of road ecology encompassing all phases of a transportation project. This book covers research and monitoring to span the entire project continuum, starting with planning and design through construction and into maintenance and management. It focuses on impacts and solutions for species groups and specific regions, with particular emphasis on the unique challenges facing Asia, South America, and Africa. Other key features: Contributions from authors originating from over 25 countries, including from all continents. Each chapter summarizes important lessons and includes lists of further reading and thoroughly up-to-date references. Highlights principles that address key points relevant to all phases in all road projects. Explains best practices based on a number of successful international case studies. Chapters are stand-alone but they also build upon and complement each other. Extensive cross-referencing directs the reader to relevant material elsewhere in the book. Handbook of Road Ecology offers a comprehensive summary of approximately 30 years of global efforts to quantify the impacts of roads and traffic and implement effective mitigation. As such, it is essential reading for those involved in the planning, design, assessment, and construction of new roads, the management and maintenance of existing roads, and the modifying or retrofitting of existing roads and problem locations. This handbook is an accessible resource for both developed and developing countries, including government transportation agencies, government environmental conservation agencies, NGOs, and road funding and donor organizations.

Introduction To The Biology Of Marine Life John Morrissey, James L. Sumich, Deanna R. Pinkard-Meier, 2016-11-01 Introduction to the Biology of Marine Life is an introductory higher education textbook for students with no prior knowledge of marine biology. The book uses selected groups of marine organisms to provide a basic understanding of biological principles and processes that are fundamental to sea life.
