Mathsliteracy Paper1 November 2014 Answers:

Frontiers in the Acquisition of Literacy Claire M. Fletcher-Flinn, 2015-09-28 Learning to read and to spell are two of the most important cultural skills that must be acquired by children and for that matter anyone learning a second language. We are not born with an innate ability to read. A reading system of mental representations that enables us to read must be formed in the brain. Learning to read in alphabetic orthographies is the acquisition of such a system which links mental representations of visual symbols (letters in print words) with pre-existing phonological sound and semantic comprehension cognitive systems for language. Although spelling draws on the same representational knowledge base and is usually correlated with reading, the acquisition processes involved are not quite the same. Spelling requires the sequential production of letters in words and at beginning levels there may not be a full degree of integration of phonology with its representation by the orthography. Reading on the other hand requires only the recognition of a word for pronunciation. Hence spelling is more difficult than reading and learning to spell may necessitate more complete representations or more conscious access to them. The learning processes that children use to acquire such cognitive systems in the brain and whether these same processes are universal across different languages and orthographies are central theoretical questions. Most children learn to read and spell their language at the same time, thus the co-ordination of these two facets of literacy acquisition needs explication as well as the effect of different teaching approaches on acquisition. Lack of progress in either reading and/or spelling is also a major issue of concern for parents and teachers, necessitating a cross-disciplinary approach to the problem encompassing major efforts from researchers in neuroscience, cognitive science, experimental psychology and education. The purpose of this Research Topic is to summarize and review what has been accomplished so far and to further explore these general issues. Contributions from different perspectives are welcomed and could include theoretical, computational and empirical works that focus on the acquisition of literacy including cross-orthographic research.

An Age of Accountability John L. Rury, 2023-10-13 An Age of Accountability highlights the role of test-based accountability as a policy framework in American education from 1970 to 2020. For more than half a century, the quest to hold schools and educators accountable for academic achievement has relied almost exclusively on standardized assessment. The theory of change embedded in almost all test-based accountability programs held that assessment with stipulated consequences could lead to major improvements in schools. This was accomplished politically by proclaiming lofty goals of attaining universal proficiency and closing achievement gaps which repeatedly failed to materialize. But even after very clear disappointments, no other policy framework has emerged to challenge its hegemony. The American public today has little confidence in institutions to improve the quality of goods and services they provide, especially in the public sector. As a consequence, many Americans continue to believe that accountability remains a vital necessity, even if educators and policy scholars disagree.
