

3.7 The oil drain plug (arrowed) is located at the rear of the sump - use a ring spanner or socket to remove it

3.13 The oil filter is located on the left side of the engine - use a filter wrench for removal (tighten the new filter by hand)

3.15 Lubricate the oil filter gasket with clean engine oil before refitting the filter

exhaust components will be warm during the actual work, so try to anticipate any potential problems before the engine and accessories are hot.

5. Park the vehicle on a level spot. Start the engine and allow it to reach its normal operating temperature (the needle on the temperature gauge should be at least above the bottom mark). Warm oil and contaminants will flow out more easily. Turn off the engine when it's warmed up. Remove the oil filter cap located next to the valve cover.

6. Raise the vehicle and support it on axle stands.

Warning: To avoid personal injury, never get beneath the vehicle when it is supported by only a jack. The jack provided with your vehicle is designed solely for raising the vehicle to remove and replace the wheels. Always use axle stands to support the vehicle when it becomes necessary to place your body underneath the vehicle.

7. Being careful not to touch the hot exhaust components, place the drain pan under the drain plug in the bottom of the pan and remove the plug (see illustration). You may want to wear gloves while unscrewing the plug the first few turns if the engine is really hot.

8. Allow the old oil to drain into the pan. It may be necessary to move the pan farther under the engine as the oil flow slows to a trickle. Inspect the old oil for the presence of metal shavings and chips.

9. After all the oil has drained, wipe off the drain plug with a clean rag. Even minute metal particles clinging to the plug would immediately contaminate the new oil.

10. Clean the area around the drain plug opening, refit the plug and tighten it securely, but do not strip the threads.

11. Move the drain pan into position under the oil filter.

12. Remove all tools, rags, etc. from under the vehicle, being careful not to spill the oil in the drain pan, then lower the vehicle.

13. Loosen the oil filter (see illustration) by turning it anti-clockwise with the filter wrench. Any standard filter wrench should work. Once

the filter is loose, use your hands to unscrew it from the block. Just as the filter comes away from the block, immediately tilt the open end up to prevent the oil inside the filter from spilling out.

Warning: The engine exhaust pipes may still be hot, so be careful.

14. With a clean rag, wipe off the mounting surface on the block. If a residue of old oil is allowed to remain, it will smoke when the block is heated up. It will also prevent the new filter from seating properly. Also make sure that the none of the old gasket remains stuck to the mounting surface. It can be removed with a scraper if necessary.

15. Compare the old filter with the new one to make sure they are the same type. Smear some engine oil on the rubber gasket of the new filter and screw it into place (see illustration). Because over-tightening the filter will damage the gasket, do not use a filter wrench to tighten the filter. Tighten it by hand until the gasket contacts the sealing surface. Then seat the filter by giving it an additional 3/4-turn.

16. Add new oil to the engine through the oil filter cap next to the valve cover. Use a spout or funnel to prevent oil from spilling onto the top of the engine. Pour three litres of fresh oil into the engine. Wait a few minutes to allow the oil to drain into the pan, then check the level on the oil dipstick (see "Weekly checks"). If the oil level is at or near the H mark, refit the filter cap hand tight, start the engine and allow the new oil to circulate.

17. Allow the engine to run for about a minute. While the engine is running, look under the vehicle and check for leaks at the sump drain plug and around the oil filter. If either is

Note: It is antiseptic and illegal to dump oil down the drain. To find the location of your local oil recycling bank, call this number free.

leaking, stop the engine and tighten the plug or filter slightly.

18. Wait a few minutes to allow the oil to trickle down into the pan, then recheck the level on the dipstick and, if necessary, add enough oil to bring the level to the H mark.

19. During the first few trips after an oil change, make it a point to check frequently for leaks and proper oil level.

20. The old oil drained from the engine cannot be reused in its present state and should be disposed of. Check with your local authority, or with a local garage to see whether they will accept the oil for recycling. Don't pour used oil into drains or onto the ground. After the oil has cooled, it can be drained into a suitable container (capped plastic jugs, topped bottles, etc.) for transport to an approved disposal site.

4 Spark plug check

1. Spark plug renewal requires a spark plug socket which fits onto a ratchet spanner. This socket is lined with a rubber grommet to protect the porcelain insulator of the spark plug and to hold the plug while you insert it into the spark plug hole. You will also need a wire-type feeler gauge to check and adjust the spark plug gap and a torque wrench to tighten the new plugs to the specified torque (see illustration).

2. If you are replacing the plugs, purchase the new plugs, adjust them to the proper gap and then replace each plug one at a time. **Note:** When buying new spark plugs, it's essential that you obtain the correct plugs for your specific vehicle. This information can be found in the Specifications Section at the beginning of this Chapter, on the Vehicle Emissions Control Information (VECI) label located on the underside of the bonnet (where fitted) or in the owner's manual. If these sources specify different plugs, purchase the spark plug type specified on the VECI label because that information is provided specifically for your engine.
