Key Aspects of Himalayan Geology Sandipan Ghosh, 2025-03-27 This book serves as a ready reference book for anyone who is interested in the Himalayan geology and appraises the readers with the latest findings. The Himalayan syntaxes compose about one third of the India Asia collision zone and encompass a substantial part of the crustal deformation that occurs within the system. The Darjeeling Sikkim Himalaya DSH marks the beginning of the Eastern Himalaya which is the most active orogenic zone coupled with variable seismicity. It is located between Bhutan to the east and Nepal to the west. In the west Sikkim shares Kanchenjunga Earth's third highest mountain with Nepal while the ridge line forming Sikkim's eastern border flanks the Yadong Gulu rift graben. DSH craved by the river system of Tista is a large geodynamic laboratory of nature where orogen is still in youth to early mature phases of evolution. Giant scale endogenous turmoil thoroughly overhauled terrain mostly within the confines of distinct belts or divisions and spectacularly uplifted the terrain in superlative terms. Resting on the foundation of structure tectonics geomorphology stratigraphy and evolution the wings of geology extend much further. Several books mostly having regional approaches of different scales have been written on the Himalayan geology with specified intentions. Geological Aspects of the DSH is based on more than direct references and succinctly opens a gateway to variable aspects of mineral study active tectonics crustal deformation tectono stratigraphy seismicity sedimentary geology palaeontology landslides and tectonic geomorphology. The book appraises the readers with the latest findings. The book is addressed to university students for their academic needs and to those who are willing to work in Himalayan terrain. The large number of topics covered in this book is hardly available in any other single book so far. Anyone interested in the geology of the Himalaya might use the book as a quick reference. Different Dimensions of Geology and Geomorphology are described in nine key chapters.

Stéphane Joost,Michael W. Bruford,Ino Curik,Juha Kantanen,Johannes A. Lenstra,Johann Sölkner,Göran Andersson,Philippe V. Baret,Nadine Buys,Jutta Roosen,Michèle Tixier-Boichard,Paolo Ajmone Marsan,2016-01-28 The history of livestock started with the domestication of their wild ancestors a restricted number of species allowed to be tamed and entered a symbiotic relationship with humans In exchange for food shelter and protection they provided us with meat eggs hides wool and draught power thus contributing considerably to our economic and cultural development Depending on the species domestication took place in different areas and periods After domestication livestock spread over all inhabited regions of the earth accompanying human migrations and becoming also trade objects This required an adaptation to different climates and varying styles of husbandry and resulted in an enormous phenotypic diversity Approximately 200 years ago the situation started to change with the rise of the concept of breed Animals were selected for the same visible characteristics and crossing with different phenotypes was reduced This resulted in the formation of different breeds mostly genetically isolated from other populations A few decades ago selection pressure was increased again with intensive production focusing on a limited range of types and a subsequent loss of genetic diversity For short term economic reasons farmers have abandoned traditional breeds As a consequence during the 20th century at least 28% of farm animal breeds became extinct rare or endangered The situation is alarming in developing countries where native breeds adapted to local environments and diseases are being replaced by industrial breeds In the most marginal areas farm animals are considered to be essential for

viable land use and in the developing world a major pathway out of poverty Historic documentation from the period before the breed formation is scarce Thus reconstruction of the history of livestock populations depends on archaeological archaeological and DNA analysis of extant populations Scientific research into genetic diversity takes advantage of the rapid advances in molecular genetics Studies of mitochondrial DNA microsatellite DNA profiling and Y chromosomes have revealed details on the process of domestication on the diversity retained by breeds and on relationships between breeds However we only see a small part of the genetic information and the advent of new technologies is most timely in order to answer many essential questions High throughput single nucleotide polymorphism genotyping is about to be available for all major farm animal species The recent development of sequencing techniques calls for new methods of data management and analysis and for new ideas for the extraction of information To make sense of this information in practical conditions integration of geo environmental and socio economic data are key elements The study and management of farm animal genomic resources FAnGR is indeed a major multidisciplinary issue The goal of the present Research Topic was to collect contributions of high scientific quality relevant to biodiversity management and applying new methods to either new genomic and bioinformatics approaches for characterization of FAnGR to the development of FAnGR conservation methods applied ex situ and in situ to socio economic aspects of FAnGR conservation to transfer of lessons between wildlife and livestock biodiversity conservation and to the contribution of FAnGR to a transition in agriculture FAnGR and agro ecology

Regulatory potential of post-translational modifications in bacteria Ivan Mijakovic, Christophe Grangeasse, Jörg Stülke, 2015-07-22 Post translational modifications PTMs are widely employed by all living organisms to control the enzymatic activity localization or stability of proteins on a much shorter time scale than the transcriptional control In eukarya global analyses consistently reveal that proteins are very extensively phosphorylated acetylated and ubiquitylated Glycosylation and methylation are also very common and myriad other PTMs most with a proven regulatory potential are being discovered continuously The emergent picture is that PTM sites on a single protein are not independent modification of one residue often affects positively or negatively modification of other sites on the same protein The best example of this complex behavior is the histone bar code with very extensive cross talk between phosphorylation acetylation and methylation sites Traditionally it was believed that large networks of PTMs exist only in complex eukaryal cells which exploit them for coordination and fine tuning of various cellular functions PTMs have also been detected in bacteria but the early examples focused on a few important regulatory events based mainly on protein phosphorylation The global importance and abundance of PTMs in bacterial physiology was systematically underestimated In recent years global studies have reported large datasets of phosphorylated

acetylated and glycosylated proteins in bacteria Other modifications of bacterial proteins have been recently described pupylation methylation sirtuin acetylation lipidation carboxylation and bacillithiolation As the landscape of PTMs in bacterial cells is rapidly expanding primarily due to advances of detection methods in mass spectrometry our research field is adapting to comprehend the potential impact of these modifications on the cellular physiology The field of protein phosphorylation especially of the Ser Thr Tyr type has been profoundly transformed We have become aware that bacterial kinases phosphorylate many protein substrates and thus constitute regulatory nodes with potential for signal integration They also engage in cross talk and eukaryal like mutual activation cascades The regulatory potential of protein acetylation and glycosylation in bacteria is also rapidly emerging and the cross talk between acetylation and phosphorylation has been documented This topic deals with the complexity of the PTM landscape in bacteria and focus in particular on the physiological roles that PTMs play and methods to study them The topic is associated to the 1st International Conference on Post Translational Modifications in Bacteria September 9 10 2014 G ttingen Germany

Cancer Metabolic Reprogramming through Molecular Imaging Franca Podo, Zaver M. Bhujwala, Egidio Iorio, 2017-07-27 The inclusion of oncogene driven reprogramming of energy metabolism within the list of cancer hallmarks Hanahan and Weinberg Cell 2000 2011 has provided major impetus to further investigate the existence of a much wider metabolic rewiring in cancer cells which not only includes deregulated cellular bioenergetics but also encompasses multiple links with a more comprehensive network of altered biochemical pathways This network is currently held responsible for redirecting carbon and phosphorus fluxes through the biosynthesis of nucleotides amino acids lipids and phospholipids and for the production of second messengers essential to cancer cells growth survival and invasiveness in the hostile tumor environment The capability to develop such a concerted rewiring of biochemical pathways is a versatile tool adopted by cancer cells to counteract the host defense and eventually resist the attack of anticancer treatments Integrated efforts elucidating key mechanisms underlying this complex cancer metabolic reprogramming have led to the identification of new signatures of malignancy that are providing a strong foundation for improving cancer diagnosis and monitoring tumor response to therapy using appropriate molecular imaging approaches In particular the recent evolution of positron emission tomography PET magnetic resonance spectroscopy MRS spectroscopic imaging MRSI functional MR imaging fMRI and optical imaging technologies combined with complementary cellular imaging approaches have created new ways to explore and monitor the effects of metabolic reprogramming in cancer at clinical and preclinical levels Thus the progress of high tech engineering and molecular imaging technologies combined with new generation genomic proteomic and phosphoproteomic methods can significantly improve the clinical effectiveness of image based interventions in cancer and provide novel insights to design and validate new targeted therapies The Frontiers in Oncology Research Topic Exploring Cancer Metabolic Reprogramming Through Molecular Imaging focusses on current achievements challenges and needs in the application of molecular imaging methods to explore cancer metabolic reprogramming and evaluate its potential impact on clinical
