Gas Variables

How are the variables that describe a gas related?

Why?

Imagine buying a balloon bouquet at a party store. How will the helium gas in the bouquet behave if you carry it outside on a hot summer day? How will it behave if you carry it outside during a snowstorm? What happens if the balloons are made of latex, which can stretch? What happens if the balloons are made of Mylar[®], which cannot stretch? What if you add just a small amount of gas to each balloon? What if you add a lot of gas? In this activity, you will explore four variables that quantify gases—pressure (P), volume (V), temperature (T), and moles (n) of gas. These four variables can be related mathematically so that predictions about gas behavior can be made.

Model 1 – Gases in a Nonflexible Container

Experiment A (Adding more gas)

A.1

Volume = 1 unit External pressure = 1 atm Internal pressure = 1 atm Temperature = 200 K.

A.2

Volume = 1 unit External pressure = 1 atm Internal pressure = 2 atm Temperature = 200 K

A.3

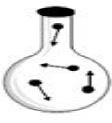

Volume = 1 unit External pressure = 1 atm Internal pressure = 3 atm Temperature = 200 K

Experiment B (Heating the gas)

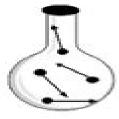

B4T

Volume = 1 unit External pressure = 1 atm Internal pressure = 1 atm Temperature = 200 K

B.2

Volume = 1 unit External pressure = 1 atm Internal pressure = 2 atm Temperature = 400 K.

B3

Volume = 1 unit External pressure = 1 atm Internal pressure = 3 atm Temperature = 600 K

*Wote: Volume in this model is recorded in wath rather than liters because 4 molecules of gas at the conditions given would occupy a very small space (~1 × 10⁻²⁰ µL). The particles shown here are much larger compared to the space between them than actual gas particles.

Kiresuk, Aaron Smith, Joseph E. Cardillo, 2014-02-25 There is an extensive literature on Goal Attainment Scaling GAS but the publications are widely scattered and often inaccessible covering several foreign countries and many professional disciplines and fields of application

This book provides both a user manual and a complete reference work on GAS including a comprehensive account of what the method is what its strengths and limitations are how it can be used and what it can offer The book is designed to be of interest to service providers program directors and administrators service and business organizations program evaluators researchers and students in a variety of fields No previous account of GAS has provided an up to date comprehensive description and explanation of the technique The chapters include a basic how to do it handbook step by step implementation instructions frequently occurring problems and what should be done about them methods for monitoring the quality of the goal setting process and a discussion of policy and administration issues There are many illustrations from actual applications including examples of goals scaled for the individual the specific program the agency or the total system Procedures for training and estimates of training costs are also provided **Modeling and Simulation of Carbon Emission Related Issues** Wen-Hsien Tsai, 2019-08-19 Carbon emissions reached an all time high in 2018 when global carbon dioxide emissions from burning fossil fuels increased by about 2.7% after a 1.6% increase in 2017. Thus we need to pay special attention to carbon emissions and work out possible solutions if we still want to meet the targets of the Paris climate agreement This Special Issue collects 16 carbon emissions related papers including 5 that are carbon tax related and 4 energy related papers using various methods or models such as the input output model decoupling analysis life cycle impact analysis LCIA relational analysis model generalized Divisia index model GDIM forecasting model three indicator allocation model mathematical programming real options model multiple linear regression etc The research studies come from China Taiwan Brazil Thailand and United States These researches involved various industries such as agricultural industry transportation industry power industry tire industry textile industry wave energy industry natural gas industry and petroleum industry Although this Special Issue does not fully solve our concerns it still provides abundant material for implementing energy conservation and carbon emissions reduction However there are still many issues regarding the problems caused by global warming that require research 23 European Symposium on Computer Aided Process **Engineering** Jian-Guo Wang, Jia-Lin Kang, Shyan-Shu Shieh, Shi-Shang Jang, David Shan-Hill Wong, 2013-06-10 The plant input variables are transformed into the derived variables which are physically and statistically meaningful for modeling Then this study proposed an adaptive modeling approach by employing nonnegative garrote variable selection and auto regression integrated moving average correction The high accuracy of the proposed modeling approaches makes the implementation of the model based control of ratio of air to fuel for improving boiler's efficiency readily practicable
