per life cycle mitotic nuclear divisions are replaced by meiosis I and II reducing chromosome number from the diploid level to
a haploid genome and recombining chromosome arms by crossing over In animals all this happens during formation of eggs
and sperm in yeasts before spore formation The mechanisms of reciprocal exchange at crossover chiasma sites are central to
mainstream meiosis To initiate the meiotic exchange of DNA surgical cuts are made as a form of calculated damage that
subsequently is repaired by homologous recombination These key events are accompanied by ancillary provisions at the level
of chromatin organization sister chromatid cohesion and differential centromere connectivity Great progress has been made
in recent years in our understanding of these mechanisms Questions still open primarily concern the placement of and
mutual coordination between neighboring crossover events Of overlapping significance this book features two
comprehensive treatises of enzymes involved in meiotic recombination as well as the historical conceptualization of meiotic
phenomena from genetical experiments More specifically these mechanisms are addressed in yeasts as unicellular model
eukaryotes Furthermore evolutionary subjects related to meiosis are treated Solutions Manual for An Introduction to
