

Applications of Arc Lengths and Sectors

A sector of a circle is a region of the circle bounded by a central angle and the intercepted arc.

A proportionality relationship exists between the central angle bounding the sector and the complete circle. This leads to a useful relationship that allows us to express the arc length of a circle of radius r (intercepted angle) and the area of sectors of circles. This section gives the formulas for arc length of a circle of radius r in degrees.

$$\text{Arc Length} = \frac{\theta}{360} \text{ (circumference of circle)}$$

Another way to find arc length is to think about unit or unit circle relationships. As you recalled from the previous activity, the circumference of a circle of radius r is simply a function of that circle's circumference. This relationship can be expressed in terms of r . This relationship can be summarized as follows:

$$\frac{\text{Arc Length}}{r} = \frac{\text{Degrees of Arc}}{360}$$

Similarly, you can express a function that would be useful to find the area of a sector of a circle of radius r and angle of measure θ in degrees as follows:

$$\frac{\text{Area of Sector}}{r^2} = \frac{\text{Degrees of Arc}}{360} \text{ (area of circle)}$$

As you recalled from the previous activity, you discovered that the arc length and area of a sector are proportional to the circle's circumference and area respectively. This relationship is summarized as follows:

$$\frac{\text{Arc Length}}{r} = \frac{\text{Area of Sector}}{r^2}$$

Example: (Based on the example from the previous activity.)

- If the radius of a circle is 10 units and the angle is 60 degrees, find the arc length and area of that sector.
