[To investigate the growth enhancing effect of Aloe vera gel on germinating seeds]

Abstract

gel affect their rate of germination?

My essay aims to investigate the growth enhancing effect of Aloe vera get on germinating seeds. The idea of carrying out this investigation came to me after going through a research paper in which the effect of cactus extracts on seed germination were studied. Since I could not find any previously done research on the growth enhancing effect of Aloe vera get, all the data collected and the investigation is first hand. In my investigation I used 5 different species of seeds; each seed was taken in two batches. One of the batches was treated with Aloe vera get and the other batch was used as a control to observe any distinction in the type of growth. These seeds were then left to germinate and observed for a period of 6 days. The observations showed that the seeds treated with Aloe vera get showed rigor in growth and hence to explain this growth enhancing effect of the get it is turther put to test for various parameters moisture content, carbohydrates, proteins, nitrates). The results of the analysis justified the observation that I obtained in the latter part of the experiment. Therefore based on the results I concluded that treatment with Aloe vera get caused most of the seeds the seeds to germinate faster either because of the great moisture retaining ability or because it helps the seeds to overcome dormancy. The growth enhancing effect of the get can be beneficial to the agricultural industries since they can coat the seed with the get before selling them, this will cause the seeds not only to germinate faster but also decrease the wastage of seeds incapable of early germination.

Introduction

"Germination is the growth of anembryonicplant contained within a seed"[1], in simple words germination is the process in which a seedling starts to grow from its state of dormancy. In its state of dormancy there are no metabolic activities taking place in the cell. When the cell is finally exposed to favorable conditions the metabolic processes resume and it germinates. For a seed to germinate some factors that need to be favorable include:

a) Water seeds are generally dry and therefore need plenty of water to initiate the metabolic processed in the seed. Seeds need this water to moisten and to swell up and break the seed coat to grow into plants. The seeds also use water to activate the hydraulic enzymes. These enzymes then go on to breakdown the reserved food into useful chemical energy.

b) Oxygen: oxygen helps the leaf to respire since the leaf requires some energy before it finally starts photosynthesizing. The seed initially gets this oxygen from the pores in the soil where air is trapped.

c) Temperature: temperature is the main factor affecting the activation process. This is because temperature plays a key role in the activity of enzymes. Enzymes are temperature specific and therefore under extremely low conditions they are deactivated and under extremely high temperatures they denature due to alteration in their active sites[2]. Therefore the seed needs an optimum temperature to start germinating. Therefore the seed needs an optimum temperature to start germinating. Therefore the seed needs an optimum temperature to start germinating. Therefore the seeds do not germinate, because they are killed by external factors such as unfavorable environmental conditions, animals or pathogens or they are quiescent[3]. Sometimes tailure to germinate is termed as dormancy. Dormancy does not have a specific definition but is the measured by the absence of germination, a condition in which a seed is not allowed to germinate. This condition is controlled by many factors, water, temperature, gases, hormones, enzymes, etc. these conditions block germination not letting the seeds to grow. This is what causes the seeds to survive harsh conditions until finally under favorable conditions they germinate. Dormancy is incorrectly associated with the absence of germination, whereas it defines the factors that are actually necessary for germination. The factors that are favorable for germination are indeed the factors that terminate seed dormancy and induce germination. There are many types of seed domancies [4]

Psychological dormancy: is the most abundant form, found in most gymnosperms and all major angiosperms.
 There are three levels to this kind of dormancy deep, intermediate and non-deep. In deep dormancy they either don't grow or produce abnormal seedlings, in intermediate dormancy the seeds produce normal seedlings, GA
