✓ Exclusively available on IvyPanda

Introduction

The introduction of genetically modified foods, GMFs, has been quite rapid, especially in the US. Stewart report that in the year 1996, "transgenic crops covered 1.7 million hectares worldwide"(5). Presently, there are more than fifty individual transgenic products that involve thirteen separate crops (Stewart 6).

Statistics indicate that in 2009, more than fourteen million large, as well as small-scale farmers in twenty-five nations across the world had planted one hundred and thirty-four million hectares. This was a seven-percent increase compared to the year 2008 (Johnson 43). A prediction has been made that, within the next twenty years, the gene technology "will touch every type of agricultural crop in the world, although this will depend on a high-level of consumer acceptance" (Johnson 48).

GM technology has revolutionized how agricultural practices are being conducted around the world. Many nations believe GM technology is the way forward to self-sustaining in food security, and as a source of foreign exchange. This is unlike traditional agricultural practices which are labor intensive but low yielding.

Thus, various research affirms the technology will likely shape the future agricultural practices in terms of increasing food production and foreign exchange. However, fears such as human and plant health in regard to the technology are major concerns that are being discussed by various stakeholders across the world.

Genetically Modified Food, GMF

GMF is a popular word in the food industries. Jukes (61) defines the term as the food derived from genetically modified organism, GMO. According to Feight and Nashat (156) the genetic engineering process is used to alter the GMF DNA composition.
