B4 – Homeostasis

What makes up homeostasis

- Homeostasis – Maintaining a constant internal environment
 - Keeping everything functioning properly.
 - Water control – Balance between water you gain (food, drink and respiration) and the water you lose (sweat, mucus and everything out); maintaining balance
 - Body temperature – Difference of a colder water outside your body keeps a pretty average temperature.
- Control and release can affect homeostasis
 - Nervous system
 - Temperature – When you shiver you generate heat, so your body temperature increases.
 - Water control – How much and how often multiple water excretion rate depends.
 - Salt levels – Need constant salt, so when you sweat it decreases.
 - Endocrine system
 - Hot climates – Sweat excretion increases
 - Cold climates – Can cause your body temperature to decrease rapidly.
- Humidity/Climate
 - Temperature increase and cold climate. High altitudes also affect blood oxygen levels, so they're further contributing to altitude sickness.
- Active living
 - Temperature drops in cold water, so you're more aware of your body and it's more important you can develop enough muscle.

Negative Feedback

- Negative feedback mechanisms change
 - Different cell types producing responses and everything is back to the centre.
- Some artificial systems work like body control systems
 - Like the thermostat, has two paths off, two cold machines.

Diffusion

- Diffusion is the passive overall movement of particles from a region of higher concentration to a region of lower concentration.
 - The bigger the difference in concentration, the faster the diffusion rate.
- Some chemicals can move in and out of cells by diffusion
 - Cells produce CO_2 , which means there's a difference of it in cells than the blood, so diffusion takes that blood to be carried away.
