**Numeracy in Authentic Contexts** Maura Sellars, 2017-10-25 This book is based on the notion that there are many ways in which mathematics learning can be achieved for students and that not all of them are focused on the mathematics classroom It explores the foundational numeracy principles of the non mathematical subject areas and aligns these to the Australian numeracy learning continuum It demonstrates in detail the extent to which numeracy competencies underpin successful learning in all the subject areas of the curricula It validates a focus of developing numeracy competencies through learning in the arts science and other discipline areas with which school

students to engage with in order develop holistically but which are not subjected to national assessment practices It is developed around the notion of praxis putting theory into practice in order to respond to the urgent need for students to be supported in their efforts to increase their numeracy capabilities in a world where extensive amounts of new information are often presented in graphical or data based formats Additionally it offers perspectives on developing all students capacities to become numerate in school contexts and presents inclusive differentiated lesson examples as an alternative way of exploring numeracy in the context of teaching and learning in real world classroom contexts

*Twisted Isospectrality, Homological Wideness, and Isometry* Gunther Cornelissen, Norbert Peyerimhoff, 2023-05-10 The question of reconstructing a geometric shape from spectra of operators such as the Laplace operator is decades old and an active area of research in mathematics and mathematical physics This book focusses on the case of compact Riemannian manifolds and in particular the question whether one can find finitely many natural operators that determine whether two such manifolds are isometric coverings The methods outlined in the book fit into the tradition of the famous work of Sunada on the construction of isospectral non isometric manifolds and thus do not focus on analytic techniques but rather on algebraic methods in particular the analogy with constructions in number theory methods from representation theory and from algebraic topology The main goal of the book is to present the construction of finitely many twisted Laplace operators whose spectrum determines covering equivalence of two Riemannian manifolds The book has a leisure pace and presents details and examples that are hard to find in the literature concerning fiber products of manifolds and orbifolds the distinction between the spectrum and the spectral zeta function for general operators strong isospectrality twisted Laplacians the action of isometry groups on homology groups monomial structures on group representations geometric and group theoretical realisation of coverings with wreath products as covering groups and class field theory for manifolds The book contains a wealth of worked examples and open problems After perusing the book the reader will have a comfortable working knowledge of the algebraic approach to isospectrality This is an open access book
