Abstract. Some studies have suggested that individuals who are sexually abused during childhood experience increased rates of mental health problems later in life. However, there is evidence suggesting that some individuals who were sexually abused as children do not experience mental health problems later in life. This study examined the relationship between childhood sexual abuse and mental health problems in adulthood. The sample consisted of 100 individuals who had been sexually abused as children and 100 individuals who had not been sexually abused as children. The results showed that individuals who had been sexually abused as children experienced higher rates of mental health problems than those who had not been sexually abused as children.
