

An axial load P is applied to a 150"-long continuous bar with the cross-sectional areas (A) shown in the figure below. The stress-strain relation of the material used to make this bar obtained during a tension test can be expressed as follows

$$\epsilon = \frac{\sigma}{16000} + \left(\frac{\sigma}{165}\right)^3$$

where σ is the normal stress in ksi.

- Determine the axial elongation (in inch) and strain (in %) of the bar when $P=5$ kips.
- Find the permanent elongation (in inch) and strain (in %) of the bar after removal of P in a).

Note: You can assume that the elastic modulus (E) of material of the bar is equal, at all times, to the slope of the stress-strain curve at the origin.

Fluid Power Practice Problem:

Fluid Power Circuits and Controls John S. Cundiff, Michael F. Kocher, 2019-12-05 Fluid Power Circuits and Controls Fundamentals and Applications Second Edition is designed for a first course in fluid power for undergraduate engineering students After an introduction to the design and function of components students apply what they've learned and consider how the component operating characteristics interact with the rest of the circuit The Second Edition offers many new worked examples and additional exercises and problems in each chapter Half of these new problems involve the basic analysis of specific elements and the rest are design oriented emphasizing the analysis of system performance The envisioned course does not require a controls course as a prerequisite however it does lay a foundation for understanding the extraordinary productivity and accuracy that can be achieved when control engineers and fluid power engineers work as a team on a fluid power design problem A complete solutions manual is available for qualified adopting instructors **PPI FE Chemical**
