First, draw arrows to indicate the direction of blood flow through the heart. Draw the pathway of the oxygen-rich blood with red arrows, and trace the pathway of oxygen-poor blood with blue arrows.

Second, identify each of the elements of the intrinsic conduction system (numbers 1-5 on the figure) by inserting the appropriate terms in the blanks left of the figure. Then, indicate with green arrows the pathway that impulses take through this system.

Third, correctly identify each of the heart valves (numbers 6-9 on the figure) by inserting the appropriate terms in the blanks left of the figure, and draw in and identify by name the cordlike structures that anchor the flaps of the atrioventricular (AV) valves.

Fourth, use the numbers from the figure to identify the structures described below. Place the numbers in the lettered answer blanks.

Hull, 2020-08-03 Updated in content and pedagogy this 14th Edition of Memmler's the Human Body in Health and Disease has helped hundreds of thousands of allied health students including those with little background in science to master anatomy and physiology From its pioneering use of phonetic pronunciations to its pedagogically effective skin to bone transparencies of the human body and increased focus on visualization the new edition continues to set the standard for the one semester course *Improving Assessments of Hemodynamics and Vascular Disease* Magnus Ziegler, 2019-04-17 Blood vessels are more than simple pipes passively enabling blood to pass through them Their form and function are dynamic changing with both aging and disease This process involves a feedback loop wherein changes to the shape of a blood vessel affect the hemodynamics causing yet more structural adaptation This feedback loop is driven in part by the hemodynamic forces generated by the blood flow and the distribution and strength of these forces appear to play a role in the initiation progression severity and the outcome of vascular diseases Magnetic Resonance Imaging MRI offers a

unique platform for investigating both the form and function of the vascular system The form of the vascular system can be examined using MR based angiography to generate detailed geometric analyses or through quantitative techniques for measuring the composition of the vessel wall and atherosclerotic plaques To complement these analyses 4D Flow MRI can be used to quantify the functional aspect of the vascular system by generating a full time resolved three dimensional velocity field that represents the blood flow This thesis aims to develop and evaluate new methods for assessing vascular disease using novel hemodynamic markers generated from 4D Flow MRI and quantitative MRI data towards the larger goal of a more comprehensive non invasive examination oriented towards vascular disease In Paper I we developed and evaluated techniques to quantify flow stasis in abdominal aortic aneurysms to measure this under explored aspect of aneurysmal hemodynamics In Paper II the distribution and intensity of turbulence in the aorta was quantified in both younger and older men to understand how aging changes this aspect of hemodynamics A method to quantify the stresses generated by turbulence that act on the vessel wall was developed and evaluated using simulated flow data in Paper III and in Paper V this method was utilized to examine the wall stresses of the carotid artery The hemodynamics of vascular disease cannot be uncoupled from the anatomical changes the vessel wall undergoes and therefore Paper IV developed and evaluated a semi automatic method for quantifying several aspects of vessel wall composition These developments taken together help generate more valuable information from imaging data and can be pooled together with other methods to form a more comprehensive non invasive examination for vascular disease
