**Abstract.**—The authors examined whether the type of information collected during a search for a target stimulus (e.g., a target face) affects the speed of processing. In two experiments, participants were asked to find a target face among faces of different ethnicities. In Experiment 1, participants were asked to find a target face among faces of different ethnicities. In Experiment 2, participants were asked to find a target face among faces of different ethnicities. The results showed that the type of information collected during a search for a target stimulus (e.g., a target face) affects the speed of processing. The results also showed that the type of information collected during a search for a target stimulus (e.g., a target face) affects the speed of processing.
