Objectives:

1. Able to synthesis of hexaamminenickel(II) chloride and stoichiometric analysis the content of ammonia and chloride.
2. Able to synthesis a complex via crystallization and purification methods.
3. Able to quantify chemical component in a chemical complex via back titration method.

Introduction:

Hexaamminenickel(II) chloride, $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$, is a coordination compound whose nickel atom and six ammonia molecules constitute the cation, the anion is the chloride ion.

The amount of ammonia in the compound is determined by adding a known excess quantity of an acid to neutralize the ammonia; the excess acid is determined by back-titration using a standard solution of sodium hydroxide, with bromocresol green as the indicator. This indicator is yellow in acidic solution and blue in basic solution.

The chloride ion in the compound is titrated against mercury(II)nitrate, with diphenylcarbazone as the indicator. The colour of the indicator at the end point is pale purple.

The end-point of the titration,i.e., when the analyte has been completely reacted, is noted by observing the change of color of an indicator. The equivalence point is the point in a titration where the amount of titrant added is enough to completely neutralize the analyte solution.
