

Electric Solenoid Operation

The electric solenoid consists of the pull-in coil, 1, hold-in coil, 2, main contacts, 3, plunger, 4 and return spring, 5. The mechanism is sealed against entry of dirt and moisture.

When the starting switch is closed, battery current flows through both the pull-in coil and the hold-in coil. This moves the plunger to the engaged position. When the plunger closes the main contacts in the engaged position, the pull-in coil circuit is opened, leaving the hold-in coil to retain the plunger in the engaged position. At the same time, current flows through the main contacts to the motor.

When the starting switch is released, the magnetic field in the hold-in circuit is reduced allowing the plunger spring to move the plunger out, opening the main contacts.

Drive Spring Operation

The drive spring, 1, is fitted on the pinion shaft, 2, in order to provide a smooth and positive pinion gear engagement. When the starting switch is closed, the plunger, 3, is pulled in moving the pinion, 4, toward the ring gear, 5. If the gear teeth do not mesh, the spring will be compressed, pressing on the pinion gear. With the first rotation of the pinion, the teeth will line up and the gears will mesh.
