Good S About Math:

Educational Goods Harry Brighouse, Helen F. Ladd, Susanna Loeb, Adam Swift, 2018-01-26 An ambitious effort that succeeds in providing a fundamentally new way to talk about and think about policy choices in education Jeffrey R Henig Teachers College Columbia University We spend a lot of time arguing about how schools might be improved But we rarely take a step back to ask what we as a society should be looking for from education what exactly should those who make decisions be trying to achieve In Educational Goods two philosophers and two social scientists address this very question They begin by broadening the language for talking about educational policy educational goods are the knowledge skills and attitudes that children develop for their own benefit and that of others childhood goods are the valuable experiences and freedoms that make childhood a distinct phase of life Balancing those and understanding that not all of them can be measured through traditional methods is a key first step From there they show how to think clearly about how those goods are distributed and propose a method for combining values and evidence to reach decisions They conclude by showing the method in action offering detailed accounts of how it might be applied in school finance accountability and choice The result is a reimagining of our decision making about schools one that will sharpen our thinking on familiar debates and push us toward better outcomes Every education decision maker and every education researcher would benefit from reading this book David N Figlio School of Education and Social Policy Northwestern University Imaginative informative and unfailingly constructive Michael S McPherson co author of Lesson Plan An Agenda for Change in American Higher Education

A pronouncing Gaelic dictionary Neil MacAlpine, 1853 A Dictionary of the Gaelic Language Norman Macleod, Daniel Dewar, 1845 Approaches to Geo-mathematical Modelling Alan G. Wilson, 2016-07-25 Geo mathematical modelling models from complexity science Sir Alan Wilson Centre for Advanced Spatial Analysis University College London Mathematical and computer models for a complexity science tool kit Geographical systems are characterised by locations activities at locations interactions between them and the infrastructures that carry these activities and flows They can be described at a great variety of scales from individuals and organisations to countries Our understanding often partial of these entities and in many cases this understanding is represented in theories and associated mathematical models In this book the main examples are models that represent elements of the global system covering such topics as trade migration security and development aid together with examples at finer scales This provides an effective toolkit that can not only be applied to global systems but more widely in the modelling of complex systems All complex systems involve nonlinearities involving path dependence and the possibility of phase changes and this makes the mathematical aspects particularly interesting It is through these mechanisms that new

structures can be seen to emerge and hence the current notion of emergent behaviour The range of models demonstrated include account based models and biproportional fitting structural dynamics space time statistical analysis real time response models Lotka Volterra models representing war agent based models epidemiology and reaction diffusion approaches game theory network models and finally integrated models Geo mathematical modelling Presents mathematical models with spatial dimensions Provides representations of path dependence and phase changes Illustrates complexity science using models of trade migration security and development aid Demonstrates how generic models from the complexity science tool kit can each be applied in a variety of situations This book is for practitioners and researchers in applied mathematics geography economics and interdisciplinary fields such as regional science and complexity science It can also be used as the basis of a modelling course for postgraduate students

Aristotle and Mathematics John J. Cleary,2016-06-21 John Cleary here explores the role which the mathematical sciences play in Aristotle s philosophical thought especially in his cosmology metaphysics and epistemology He also thematizes the aporetic method by means of which he deals with philosophical questions about the foundations of mathematics The first two chapters consider Plato s mathematical cosmology in the light of Aristotle s critical distinction between physics and mathematics Subsequent chapters examine three basic aporiae about mathematical objects which Aristotle himself develops in his science of first philosophy What emerges from this dialectical inquiry is a different

conception of substance and of order in the universe which gives priority to physics over mathematics as the cosmological science Within this different world view we can better understand what we now call Aristotle s philosophy of mathematics
