*Modern High-end Valve Amplifiers* Menno van der Veen, 1999 Valve Amplifiers are regarded by many to be the ne plus ultra when it comes to processing audio signals The combination of classical technology and modern components has resulted in a revival of the valve amplifier The use of toroidal core output transformers developed by the author over the past 15 years has contributed to this revival The most remarkable features of these transformers are their extremely wide frequency ranges and their very low levels of linear and nonlinear distortion This book explains the whys and wherefores of toroidal output transformers at various technical levels starting with elementary concepts and culminating in complete mathematical descriptions In all of this the interactions of the output valves transformer and loudspeaker form the central theme Next come the practical aspects The schematic diagram of a valve amplifier often appears to be very simple at first glance but anyone who has built a modern valve amplifier knows that a lot of critical details are hidden behind this apparent simplicity These are discussed extensively in connection with designs for amplifiers with output powers ranging from 10 to 100 watts Finally the author gives some attention to a number of special valve amplifiers and to the theory and practice of negative feedback In summary this book offers innovative solutions for achieving perfect audio quality Do it yourself builders as well as persons who want to gain a deeper technical understanding of the complex world of audio transformers valve amplifiers and audio signal processing will find this book a rich and useful source of information

**Electronics Projects Vol. 4** EFY Enterprises Pvt Ltd,2009-11      **Development of a Wirelessly Powered Smart Implant to Monitor Spinal Fusion** Nicole (Nagar) Zoka,2021-01-01 Lumbar spinal fusion surgery is performed on patients in whom non operative treatments have failed to relieve chronic lower back pain LBP and restore functionality The procedure involves inserting titanium alloy rods adjacent to two or more vertebrae on each side of the spine to support spinal fusion Currently clinicians rely upon periodic x ray radiographic images to track fusion progress and determine whether patients can resume normal activities or to assess if the fusion has failed However the reliability of imaging evaluation techniques is questionable and leads to either very conservative and prolonged restrictions on activity or additional exploratory surgeries The definitive criteria for a successful fusion remain ambiguous and determining the progress of spinal fusion remains a challenge for orthopaedic surgeons and clinicians Observing strain variations on a spinal fusion rod post implantation has been demonstrated to correlate with changes in bony mass stiffness as fusion progresses indicating the state of fusion The challenge with strain measurements relates to having a reliable implant which aligns with existing clinical workflows and provides new data on the state of healing If the existing titanium alloy rod could be made smart i e the strain measurement capabilities are embedded into the rod then the existing clinical surgical workflow could be maintained This research focuses on the design and development of a smart spinal fusion implant with the potential to measure strain without complication in the surgical procedure To meet this aim two key research questions were addressed First a fully implantable wireless spinal rod was developed to support animal trials of spinal fusion The implant was constructed by mounting a semiconductor strain gauge sensor into a housing machined into a custom spinal rod A miniaturised electronic module was developed to measure the strain and transmit the data to an external wireless receiver The module consisted of a strain gauge signal conditioning which was controlled by a microcontroller and a custom wireless power and data transfer application specific integrated circuit ASIC developed previously at the Auckland Bioengineering Institute ABI The electronics module was mounted into the

housing and a printed circuit board PCB coil was placed on top of it This was sealed under a liquid crystal polymer LCP lid Wireless power was transferred to the implant from an external coil at 6.78MHz for 980ms over which 10 samples of strain were measured The data was then transmitted using phase shift keying at a data rate of 678kbps at 6.78MHz Data was received at an external coil demodulated and logged to a computer with a measurement cycle taking one second The implant was characterised on a test rig and it was confirmed that the 24 bit strain values could be wirelessly measured using the smart spinal implant designed to achieve 1 resolution This showed that the device was ready for animal trials to quantify strain as fusion occurs in a sheep model Second to make the implant clinically relevant it would be preferable to replace the LCP lid with titanium LCP is an appropriate seal for animal trials with a lifespan of around several months before water permeates through it and the device becomes unreliable Titanium can be welded to the rod to achieve a hermetic seal gas tight with a lifespan of many years which leads to a smaller device and eases reliable manufacturing as welding is possible However this would require transferring inductive power through the conductive titanium lid which has not been achieved in a spinal implant Thus inductive power transfer through metal sheets was investigated via a combination of numerical and experimental tests A simple test set up based on hand wound cylindrical 10 turn primary inner radius of 30mm and 10 turn secondary coils inner radius of 5mm was created into which metal sheets could be introduced to allow study their impact on wireless power transfer The equivalent 2D axisymmetric FEM models were developed to analyse inductive link principles and validate experimental studies The hand wound coils were also used to investigate the impact of a titanium enclosure on IWPT system parameters through both simulations and experiments The simulation results matched experimental results reasonably well validating the approach thus in the future the validated FEM simulations could be used to investigate power transfer to a miniaturised titanium packaged smart spinal fusion implant The impact of the titanium spinal fusion implant consisting of a titanium spinal rod housing and lid on an IWPT system and an optimum frequency for maximum power transfer was determined The maximum transferred power was dependent on the titanium alloy lid thickness implant size implant coil location frequency of power transmission magnitude of the primary field and primary and secondary coils dimensions and configurations FEM simulation results revealed that a maximum power of 1.84mW at 1A primary current and an operating frequency of approximately 400kHz could be transferred through a 110 μm thick Grade 5 titanium lid used to seal a 5.5mm thick 50mm long Grade 5 titanium rod and 0.5mm thick Grade 5 housing with an internal volume of 18 x 8 x 5mm L x W x H for this spinal fusion application The maximum link potential of 0.035 at 199kHz could be achieved for the same set up These results indicated that an acceptable amount of power could be transferred through titanium to power the implanted electronics supporting the future development of titanium packaged smart spinal fusion rods This research supports the hypothesis that it is feasible to construct a smart spinal fusion implant that includes the function of measuring strain can ultimately be employed in clinical practices of spinal fusion detection of the onset of fusion non union or other
