Concrete Vaulted Construction in Imperial Rome Lynne C. Lancaster, 2005-08-08 Concrete Vaulted Construction in Imperial Rome examines methods and techniques that enabled builders to construct some of the most imposing monuments of ancient Rome Focusing on structurally innovative vaulting and the factors that influenced its advancement Lynne Lancaster also explores a range of related practices including lightweight pumice as aggregate amphoras in vaults vaulting ribs metal tie bars and various techniques of buttressing She provides the geological background of the local building stones and applies mineralogical analysis to determine material provenance which in turn suggests trading patterns and land use Lancaster also examines construction techniques in relation to the social economic and political contexts of Rome in an effort to draw connections between changes in the building industry and the events that shaped Roman society from the early empire to late antiquity This book was awarded the James R Wiseman Book Award from the Archaeological Institute of America in 2007 [View Full-Size Image](#)

Corrugated-steel-web bridges FIB - Féd. Int. du Béton, 2015 To date very little has been published on the topic of corrugated steel web bridges fib Bulletin 77 offers the global engineering community a first complete overview of this fascinating technology The shear capacity of corrugated steel web began to be studied in Japan in 1965 and resulted in the use of corrugated steel in steel girder webs as a replacement for web stiffeners After Japan laid the groundwork for the technology France built the first composite bridge with corrugated steel webs and upper and lower concrete slabs in the 1980s Composite bridges had already been popular in France but engineers found that concrete slab creep meant that prestressing force spread into the steel plates causing high losses Corrugated steel web which reduces axial stiffness was welcomed as a solution to this problem and several bridges were designed and built with this technology Building on France's composite technology Japan began developing corrugated web precast box girder bridges in the 1990s and today has over 140 corrugated web bridges by far the largest number for any country in the world Japanese engineers have come a long way in solving issues such as fatigue and ultimate load behaviour and have made good use of corrugated steel web's advantages for bridge building which include reduced self weight of approximately 15% compared with the weight of an ordinary concrete box girder bridge economy and improved construction processes fib Bulletin 77 Corrugated steel web bridges covers numerous examples of bridges in Japan and France as well as an in depth case study and analysis of a large corrugated steel web bridge in Germany This publication offers designers proprietors contractors and architects alike relevant technical and theoretical information on construction processes along with ideas for future development

Precast-concrete buildings in seismic areas FIB - Féd. Int. du Béton, 2016 This document has a broad scope and is not focussed on design issues Precast construction under seismic conditions is treated as a whole The main principles of

seismic design of different structural systems their behavior and their construction techniques are presented through rules construction steps and sequences procedures and details that should lead to precast structures built in seismic areas complying with the fundamental performance requirements of collapse prevention and life safety in major earthquakes and limited damage in more frequent earthquakes The content of this document is largely limited to conventional precast construction and although some information is provided on the well known PRESSS technology jointed ductile dry connections this latter solution is not treated in detail in this document The general overview contained in this document of alternative structural systems and connection solutions available to achieve desired performance levels intends to provide engineers architects clients and end users in general with a better appreciation of the wide range of applications that modern precast concrete technology can have in various types of construction from industrial to commercial as well as residential Lastly the emphasis on practical aspects from conceptual design to connection detailing aims to help engineers to move away from the habit of blindly following prescriptive codes in their design but instead go back to basic principles in order to achieve a more robust understanding and thus control of the seismic behaviour of the structural system as a whole as well as of its components and individual connections

Shear and Punching Shear in RC and FRC Elements fib Fédération internationale du béton, 2010-12-01

fib Bulletin 57 is a collection of contributions from a workshop on Recent developments on shear and punching shear in RC and FRC elements held in Sal Italy in October 2010 Shear is one of a few areas of research into fundamentals of the behaviour of concrete structures where contention remains amongst researchers There is a continuing debate between researchers from a structures perspective and those from a materials or fracture mechanics perspective about the mechanisms that enable the force flow through a concrete member and across cracks In 2009 a Working Group was formed within fib Task Group 4.2 Ultimate Limit State Models to harmonise different ideas about design procedures for shear and punching An important outcome of this work was the ensuing discussions between experts and practitioners regarding the shear and punching provisions of the draft fib Model Code which led to the organization of the Sal workshop Invited experts in the field of shear and FRC gave 18 lectures at the workshop that was attended by 72 participants from 12 countries in 3 different continents

The contributions from this conference as compiled in this bulletin are believed to represent the best of the current state of knowledge. They certainly are of general interest to fib members and especially helpful in the finalization of the 2010 fib Model Code. It is hoped that this publication will stimulate further research in the field to refine and harmonize the available analytical models and tools for shear and punching design.

Concrete Structures for Oil and Gas Fields in Hostile Marine Environments fib Fédération internationale du béton, 2008-12-01 Concrete offshore structures have been successfully delivered to the international oil and gas industry for more than 35 years. Some 50 major concrete platforms of different shapes and sizes supporting large production and storage facilities are currently operating in hostile marine environments worldwide and have excellent service records. After some years with little development activity today there is a renewed interest in robust structures for the Arctic environment for Liquefied Natural Gas (LNG) terminals and for special floating barges and vessels. Currently concrete solutions are being considered for projects north and east of Russia north of Norway and offshore Newfoundland among others. Concrete is also in increasing demand in built up coastal areas for a variety of purposes such as harbour works, tunnels and bridges, cargo terminals, parking garages and sea front housing developments where durability and robustness are essential. The mandate of fib Task Group 1.5 was to gather the experience and know how pertinent to the development, design and execution of offshore concrete structures and to elaborate on the applicability of concrete structures for the Arctic environments. The findings of the Task Group are presented in fib Bulletin 50. The report is based on experience gained from the design, execution and performance of a number of offshore concrete structures around the world and in particular in the North Sea. Ongoing inspections have shown excellent durability and structural performance even in structures that have exceeded their design lives in conditions often characterized by extreme wave loads, freezing conditions, hurricane force winds and seismic actions. This forms the background for discussing the applicability of concrete structures for the Arctic regions. Although to a large extent dedicated to oil and gas related structures, the report is also relevant to other marine applications where the same design principles, material selection criteria and construction methods apply. fib Bulletin 50 is not in itself a code nor is it a textbook. Rather extensive reference is made to proven and readily available design codes and construction guides as well as relevant papers and proceedings and other fib publications.

Structural Concrete Textbook, Volume 5 fib Fédération internationale du béton, 2012-06-01 The third edition of the Structural Concrete Textbook is an extensive revision that reflects advances in knowledge and technology over the past decade. It was prepared in the intermediate period from the CEP FIP Model Code 1990 MC90 to fib Model Code for Concrete Structures 2010 MC2010 and as such incorporates a significant amount of information that has been already finalized for MC2010 while keeping some material from MC90 that was not yet modified considerably. The objective of the textbook is to give detailed information on a wide range of concrete engineering from selection of appropriate structural system and also materials through design and execution and finally behaviour in use. The revised fib Structural Concrete Textbook covers the

following main topics phases of design process conceptual design short and long term properties of conventional concrete including creep shrinkage fatigue and temperature influences special types of concretes such as self compacting concrete architectural concrete fibre reinforced concrete high and ultra high performance concrete properties of reinforcing and prestressing materials bond tension stiffening moment curvature confining effect dowel action aggregate interlock structural analysis with or without time dependent effects definition of limit states control of cracking and deformations design for moment shear or torsion buckling fatigue anchorages splices detailing design for durability including service life design aspects deterioration mechanisms modelling of deterioration mechanisms environmental influences influences of design and execution on durability fire design including changes in material and structural properties spalling degree of deterioration member design linear members and slabs with reinforcement layout deep beams management assessment maintenance repair including conservation strategies risk management types of interventions as well as aspects of execution quality assurance formwork and curing The updated textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design assessment or retrofitting of concrete structures It will be essential reading material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice Furthermore it should prove particularly valuable to users of the new editions of Eurocode 2 for concrete buildings bridges and container structures which are based only partly on MC90 and partly on more recent knowledge which was not included in the 1999 edition of the textbook

Model Code 2010 - Final draft fib Fédération internationale du béton, 2012-01-01 The objectives of MC2010 are to serve as a basis for future codes for concrete structures and to present new developments with regard to concrete structures structural materials and new ideas in order to achieve optimum behaviour MC2010 includes the whole life cycle of a concrete structure from design and construction to conservation assessment maintenance strengthening and dismantlement in one code for buildings bridges and other civil engineering structures Design is largely based on performance requirements The chapter on materials is extended with new types of concrete and reinforcement such as fibres and non metallic reinforcements The fib Model Code 2010 also gives corresponding explanations in a separate column of the document Additionally MC2010 is supported by background documents that have already been or will soon be published in fib bulletins and journal articles MC2010 is now the most comprehensive code on concrete structures including their complete life cycle conceptual design dimensioning construction conservation and dismantlement

Probabilistic performance-based seismic design fib Fédération internationale du béton, 2012-05-07 In the last ten to fifteen years a vast amount of research has been undertaken to improve on earlier methods for analysing the seismic reliability of structures These efforts focused on identifying aspects of prominent relevance and disregarding the inessential ones with the goal of producing methods that are both more efficient and easier to use in practice Today this goal can be said to be substantially achieved During these years scientific activity covered all of

the many aspects involved in such a multi disciplinary problem ranging from seismology to geotechnics to structural analysis and economy all of them to be consistently organised into a probabilistic framework As the output of this research was dispersed into a multitude of technical papers fib Commission 7 thought it worthwhile to select the essential aspects of this large body of knowledge and to present them into a coherent and accessible document for structural engineers To this end a task group of specialists was formed whose qualifications come from their personal involvement in the above mentioned developments throughout this period of time From its inception the group decided that the bulletin should have had a distinct educational character and provide a clear overview of the methods available The outcome is a compact volume that starts by introducing the concepts and definitions of performance based engineering continues with two chapters on assessment and design respectively presenting the methods in detail accompanied by illustrative examples and concludes with an appendix with sample programming excerpts for their implementation It is believed that at present fib Bulletin 68 represents a unique compendium on probabilistic performance based seismic design
