Artificial Cognitive Systems David Vernon, 2024-08-20 A concise introduction to a complex field bringing together recent work in cognitive science and cognitive robotics to offer a solid grounding on key issues This book offers a concise and accessible introduction to the emerging field of artificial cognitive systems Cognition both natural and artificial is about anticipating the need for action and developing the capacity to predict the outcome of those actions Drawing on artificial intelligence developmental psychology and cognitive neuroscience the field of artificial cognitive systems has as its ultimate goal the creation of computer based systems that can interact with humans and serve society in a variety of ways This primer brings together recent work in cognitive science and cognitive robotics to offer readers a solid grounding on key issues The book first develops a working definition of cognitive systems broad enough to encompass multiple views of the subject and deep enough to help in the formulation of theories and models It surveys the cognitivist emergent and hybrid paradigms of cognitive science and discusses cognitive architectures derived from them It then turns to the key issues with chapters devoted to autonomy embodiment learning and development memory and prospection

knowledge and representation and social cognition Ideas are introduced in an intuitive natural order with an emphasis on the relationships among ideas and building to an overview of the field The main text is straightforward and succinct sidenotes drill deeper on specific topics and provide contextual links to further reading

Invertebrate Learning and Memory Randolph Menzel, Paul Benjamin, 2013-06-18 Understanding how memories are induced and maintained is one of the major outstanding questions in modern neuroscience This is difficult to address in the mammalian brain due to its enormous complexity and invertebrates offer major advantages for learning and memory studies because of their relative simplicity Many important discoveries made in invertebrates have been found to be generally applicable to higher organisms and the overarching theme of the proposed will be to integrate information from different levels of neural organization to help generate a complete account of learning and memory Edited by two leaders in the field *Invertebrate Learning and Memory* will offer a current and comprehensive review with chapters authored by experts in each topic The volume will take a multidisciplinary approach exploring behavioral cellular genetic molecular and computational investigations of memory Coverage will include comparative cognition at the behavioral and mechanistic level developments in concepts and methodologies that will underlie future advancements and mechanistic examples from the most important vertebrate systems nematodes molluscs and insects Neuroscience researchers and graduate students with an interest in the neural control of cognitive behavior will benefit as will as will those in the field of invertebrate learning Presents an overview of invertebrate studies at the molecular cellular neural levels and correlates findings to mammalian behavioral investigations Linking multidisciplinary approaches allows for full understanding of how molecular changes in neurons and circuits underpin behavioral plasticity Edited work with chapters authored by leaders in the field around the globe the broadest most expert coverage available Comprehensive coverage synthesizes widely dispersed research serving as one stop shopping for comparative learning and memory researchers

The Agile Mind Wilma Koutstaal, 2012 In this book Wilma Koutstaal covers all aspects of agile thought and how it emerges from and interacts with memory perception emotion executive control motivation and action as well as how it is related to creativity mediated by learning and environmental input enhanced by plasticity and destroyed by rigidity The Agile Mind brings together much theory and work in cognitive neuroscience and cognitive psychology so will be a valuable resource for researchers in those fields

Third-Generation Neuroimaging: Translating Research into Clinical Utility André Schmidt, Stefan Borgwardt, 2016-11-02 Psychiatric imaging needs to move away from simple investigations of the neurobiology underling the early phases of psychiatric diseases to translate imaging findings in the clinical field targeting clinical outcomes including transition remission and response to preventative interventions This research topic aims to bring psychiatric neuroimaging studies towards translational impacts in clinical

practice suggesting that brain abnormalities may be of potential use for detecting clinical outcomes as treatment response

First generation psychiatric neuroimaging focused on simple structural brain alterations associated with the neurobiology of the illness. These early studies adopted imaging methods mainly including computerized tomography (CT) to investigate brain size. Second generation psychiatric neuroimaging studies benefited from more sophisticated techniques which included structural methods (sMRI) coupled with whole brain automated methods (voxel based morphometry (VBM), white matter methods, diffusion tensor imaging (DTI) and tractography, functional methods (functional magnetic resonance imaging (fMRI) and advanced neurochemical imaging (PET) techniques addressing receptor bindings and pre/post synaptic functions, magnetic resonance spectroscopy (MRS) and sophisticated meta-analytical imaging methods. However, no consistent or reliable anatomical or functional brain alterations have been univocally associated with any psychiatric disorder and no clinical applications have been developed in psychiatric neuroimaging. There is thus an urgent need of psychiatric imaging to move towards third generation paradigms. In this research topic, these novel neuroimaging studies are requested to move away from simple investigations of the neurobiology to translate imaging findings in the clinical field, targeting longitudinal outcomes including transition, remission and response to preventative interventions. With respect to methods, the most recent neuroimaging approaches (e.g. structural and functional MRI, EEG, DTI, spectroscopy, PET) are welcome. Third generation psychiatric imaging studies including multimodal approaches, multi-center analyses, mega-analyses, effective connectivity, dynamic causal modelling, support vector machines, structural equation modelling or graph theory analysis are highly appreciated. Furthermore, these third generation imaging studies may benefit from the incorporation of new sources of neurobiological information such as whole genome sequencing, proteomic, lipidomic and expression profiles and cellular models derived from recent induced pluripotent stem cells research.

We collect Original Research, Reviews, Mini Reviews, Book Review, Clinical Case Study, Clinical Trial, Editorial, General Commentary, Hypothesis, Theory, Methods, Mini Opinion, Perspective and Technology Report from international researchers and clinicians in this field. The purpose of this research topic is intended to provide the field with current third generation neuroimaging approaches in translational psychiatry that is hoped to improve and create therapeutic options for psychiatric diseases.

Invertebrate Learning and Memory Elizabeth A. Tibbetts, Michael J. Sheehan, 2013-06-18 Individual recognition is often considered a cognitively challenging form of recognition because it requires flexible learning and memory Because Polistes paper wasps are one of the few invertebrates known to have individual recognition they provide a good model for exploring how individual recognition shapes cognitive evolution Here we review previous work on individual recognition in paper wasps with a particular focus on learning and memory In this review we 1 explore the evolution of individual recognition in paper wasps including the selective pressures thought to shape the origin and maintenance of individual recognition 2 discuss the extent of memory for specific individuals during paper wasp social interactions 3 describe a negative reinforcement training method that can be used for comparative learning research in wasps and other invertebrates and 4 explain how individual recognition has shaped the evolution of specialized visual learning in paper wasps

The Medicalization of Psychotherapy Sylvia Olney, 2015-04-08 The Medicalization of Psychotherapy Practicing under the Influence is an ethnographic account of the practice of clinical psychology under the reductionist auspices of biomedicine Using Peircean semiotic analysis focusing in particular on modes in meaning making Sylvia Olney proposes that consciousness should be accorded the same conceptual and value status as nature and the human body This would resolve the psyche soma split as mirrored both within and between the practice disciplines of medicine and psychotherapy and could also free practitioners and client patients from the idea of essential helplessness in the face of biology a notion which happens to contribute to the vested interests of the pharmaceutical and insurance industries Given the advances of neuroscience and psychoneuroimmunology that support the recognition of force like dimensions of mind and intention The Medicalization of Psychotherapy helps to restore the practice of psychotherapy to the significant healing art it has actually been the healing of consciousness
