

time is sufficient to compute an \mathcal{H}_∞ controller for each value of the firing factor β .

The three cantilevers exhibit resonant frequencies f_0 of 1.04, 0.07 and 0.03, respectively. Conducted resonance tests and compare the gains from road disturbance by $\omega_0, \omega_1, \omega_2$ to the positive and negative values of f_0 . It shows that all three cantilevers reduce suspension deflection and body acceleration below the set limits.

Abstract

So far you have designed H_∞ controllers that meet the performance objectives for the nominal (well-tuned) system. This model is only an approximation of the real situation and you need to make sure performance is maintained in the face of model errors and uncertainty. This is called robust performance. Next you *g*-synthesize to design *g*-controllers that achieve robust performance for the entire family of robust controllers (synthesized with the design function using the specified model errors) $\{C, D\}$ of “nominal” performance ($\beta = 0.1$).

Because the normal response is a trade-off with the initial controller error, the responses are not obtained with the balanced H_2 criterion.
