An Introduction to Modern Timekeeping and Time Transfer Parameswar Banerjee, Demetrios Matsakis, 2023-08-30 This book provides a comprehensive systematic description of modern timekeeping and its specializations Introductory chapters discuss the concept of time and its definition then briefly look at pre Atomic Era timekeeping to set the stage for the introduction of the atomic clock Subsequent chapters focus on concepts such as frequency stability and measurement uncertainty as well as computer network time synchronization protocols including Network Time Protocol NTP and Precise Time Protocol PTP The book then delves into the nuts and bolts of the Global Navigation Satellite Systems GNSS Two Way Satellite Time and Frequency Transfer and Optical

Time and Frequency Transfer Timescale theory is then described as a way to combine clock data and the algorithms and procedures used to generate Coordinated Universal Time UTC are given Finally there is a look at modern applications of timekeeping and time transfer Featuring a glossary of all key terms this book is highly recommended for trained or incoming physicists engineers or mathematicians working for example in manufacturing or timing laboratories Additionally it is suitable for use in introductory university courses dealing with the subject of timekeeping The United States Department of Commerce Publications, Catalog and Index Supplement United States. Atomic Clocks Ahmed Al-Samaneh, 2015-09-23 Frequency standards or clocks provide time references for a wide range of applications such as synchronization of communication networks remote sensing and global positioning Over the last couple of decades demands on the data rates of many communication systems have substantially increased imposing more restricted requirements on the stability of their timing devices At the same time applications have become more mobile increasing the demand for small and low power clocks Atomic clocks have provided the most stable frequency references for more than 50 years However the size and power requirements of microwave cavity based atomic clocks prohibit them from being portable and battery operated Hence research on miniaturized atomic clocks MACs has been initiated by various research groups A European research project on MACs funded by the European commission started in 2008 This dissertation reports on the achievements within the European research project in the development of suitable lasers for such atomic clocks Vertical cavity surface emitting lasers VCSELs are compelling light sources for MACs because of their low power consumption high modulation bandwidth and favorable beam characteristics VCSELs must feature polarization stable single mode emission Additionally they must provide narrow linewidth emission at a center wavelength of about 894.6 nm and be well suited for harmonic modulation at about 4.6 GHz in order to employ coherent population trapping effect at the cesium D1 line The polarization orientation of the emitted light of a standard VCSEL is a priori unknown Polarization control is achieved by etching a shallow surface grating in the top Bragg mirror For the purpose of integration with the clock microsystem flip chip bondable VCSEL designs are realized Such designs facilitate a straightforward mounting and make the electrical contacts high frequency compatible
