The Earth's Hydrological Cycle L. Bengtsson, R.-M. Bonnet, M. Calisto, G. Destouni, R. Gurney, J. Johannessen, Y. Kerr, W.A. Lahoz, M. Rast, 2014-05-02 This book gives a comprehensive presentation of our present understanding of the Earth's Hydrological cycle and the problems consequences and impacts that go with this topic Water is a central component in the Earth's system It is indispensable for life on Earth in its present form and influences virtually every aspect of our planet's life support system On relatively short time scales atmospheric water vapor interacts with the atmospheric circulation and is crucial in forming the Earth's climate zones Water vapor is the most powerful of the greenhouse gases and serves to enhance the tropospheric temperature The dominant part of available water on Earth resides in the oceans Parts are locked up in the land ice on Greenland and Antarctica and a smaller part is estimated to exist as groundwater If all the ice over the land and all the glaciers were to melt the sea level would rise by some 80 m In comparison the total amount of water vapor in the atmosphere is small it amounts to 25 kg m² or the equivalent of 25 mm water for each column of air Yet atmospheric water vapor is crucial for the Earth's energy balance The book gives an up to date presentation of the present knowledge Previously published in *Surveys in Geophysics* Volume 35 No 3 2014 [Remote Sensing of the Terrestrial Hydrologic Cycle](#) Qihong Tang, Youcun Qi, Zihui Wang, Yun Pan, 2020-06-17 This book provides a practical introduction to remote sensing applications for detecting changes in the terrestrial water cycle and understanding the causes and consequences of these changes Covering a wide range of innovative remote sensing approaches for hydrological study this book contributes significantly to the knowledge base of hydrology in the Anthropocene i.e. global change hydrology It is an excellent reference for students and professionals in the fields of hydrology climate change and geography **Water Cycle** Yves Earhart, AI, 2025-03-06 *Water Cycle* explores the Earth's essential water processes revealing how water moves continuously through evaporation condensation and precipitation Understanding this cycle is key to grasping climate patterns and managing water resources Did you know that the energy absorbed or released during water's phase changes significantly impacts global weather Also the book highlights how water's journey from raindrops to oceans shapes our planet and sustains life The book systematically introduces the water cycle's components such as evaporation and runoff enhanced by diagrams It then delves into factors influencing each component like temperature and topography and explores interactions with other Earth systems including the carbon cycle Finally it addresses human impacts like deforestation and climate change offering potential solutions This approach provides a comprehensive overview of hydrology and its role in climate patterns and environmental science *Water Cycle* offers a synthesis of current scientific knowledge presented accessibly It emphasizes the importance of water conservation and sustainable water management It connects meteorology hydrology and ecology to give a holistic perspective on water's role making it valuable for students and anyone interested in Earth sciences and environmental issues **Our Changing Planet**, 1999 [Climatic Change: Implications for the Hydrological Cycle and](#)

for Water Management Martin Beniston, 2006-04-11 year simulations in order to separate noise in the system from the climate change signal Several contributing papers focused on case studies using Regional Climate Models RCMs linked to hydrological models applied to the analysis of runoff under conditions of convective activity and extreme precipitation in regions of complex topography or stakeholder driven investigations such as water runoff simulations in Quebec undertaken for a major utility Thorough analyses of GCM results for the Century were reported at the Workshop in order to illustrate the improvements in model results which have taken place in recent years and the increasing confidence with which the models can be used for projecting climatic change in coming decades However there is still much room for improvement there is also a need to address more fully the manner in which climate and impacts models e g hydrological models can be linked in terms of consistency and the overlap between different scales the underlying physical assumptions and the parameterizations used Session 2 was devoted to the two extremes of water resources namely floods and droughts the focus here being to identify the climate change component in river floods These have significant economic implications as was shown by several scientists from Western and Central Europe Many long time series have been studied worldwide with the aim of detection of nonstationarities yet there is no conclusive evidence of climate related changes in flow records in general
