implementation can then proceed by a succession of layers such that each layer is a refinement of the previous one. Design decisions can be introduced in refinement steps one at a time. By this the refinement steps can be kept small and manageable. Still the set of all requirements can be far too large to be taken completely into account in the initial specification. Even if they could they might obscure issues more than clarify them. For example, an information system for stored goods needs to produce an error message on illegal input. Yet the exact wording and even the language of those messages is irrelevant for an understanding of the essence of the system. A banking application interacts with customers with a graphical interface. Yet the specification of the graphical layout is secondary compared to the specification of the possible transactions. **Network**

Readers are responsible for designing, implementing and managing the voice, data and video systems their companies use to support everything from business critical applications to employee collaboration and electronic commerce. Use of Services for Family Planning and Infertility, United States, 1982 Gerry E. Hendershot, Marjorie C. Horn, William D. Mosher, 1988 The 1982 statistics on the use of family planning and infertility services presented in this report are preliminary results from Cycle III of the National Survey of Family Growth (NSFG) conducted by the National Center for Health Statistics. Data were collected through personal interviews with a multistage area probability sample of 7969 women aged 15-44. A detailed series of questions was asked to obtain relatively complete estimates of the extent and type of family planning services received. Statistics on family planning services are limited to women who were able to conceive 3 years before the interview date. Overall 79% of currently married nonsterile women reported using some type of family planning service during the previous 3 years. There were no statistically significant differences between white 79%, black 75% or Hispanic 77% wives or between the 2 income groups. The 1982 survey questions were more comprehensive than those of earlier cycles of the survey. The annual rate of visits for family planning services in 1982 was 1077 visits/1000 women. Teenagers had the highest annual visit rate 1581/1000 of any age group for all sources of family planning services combined. Visit rates declined sharply with age from 1447 at ages 15-24 to 479 at ages 35-44. Similar declines with age also were found in the visit rates for white and black women separately. Nevertheless the annual visit rate for black women 1334/1000 was significantly higher than that for white women 1033. The highest overall visit rate was for black women 15-19 years of age 1867/1000. Nearly 2/3 of all family planning visits were to private medical sources. Teenagers of all races had higher family planning service visit rates to clinics than to private medical sources as did black women age 15-24. White women age 20 and older had higher visit rates to private medical services than to clinics. Never married women had higher visit rates to clinics than currently or formerly married women. Data were also collected in 1982 on use of medical services for infertility by women who had difficulty in conceiving or carrying a pregnancy to term. About 1 million ever married women had 1 or more infertility visits in the 12

months before the interview During the 3 years before interview about 1 9 million women had infertility visits For all ever married women as well as for white and black women separately infertility services were more likely to be secured from private medical sources than from clinics The survey design reliability of the estimates and the terms used are explained in the technical notes

Parallel Programming and Compilers Constantine D. Polychronopoulos, 2012-12-06 The second half of the 1970s was marked with impressive advances in array vector architectures and vectorization techniques and compilers This progress continued with a particular focus on vector machines until the middle of the 1980s The majority of supercomputers during this period were register to register Cray 1 or memory to memory CDC Cyber 205 vector pipelined machines However the increasing demand for higher computational rates lead naturally to parallel computers and software Through the replication of autonomous processors in a coordinated system one can skip over performance barriers due technology limitations In principle parallelism offers unlimited performance potential Nevertheless it is very difficult to realize this performance potential in practice So far we have seen only the tip of the iceberg called parallel machines and parallel programming Parallel programming in particular is a rapidly evolving art and at present highly empirical In this book we discuss several aspects of parallel programming and parallelizing compilers Instead of trying to develop parallel programming methodologies and paradigms we often focus on more advanced topics assuming that the reader has an adequate background in parallel processing The book is organized in three main parts In the first part Chapters 1 and 2 we set the stage and focus on program transformations and parallelizing compilers The second part of this book Chapters 3 and 4 discusses scheduling for parallel machines from the practical point
