The main components of the traveling unit include the hydraulic pump, control valve, swing joint, counter-balance valve, travel motor with reduction gear, etc.

04 Note-The Center pump is fed to the right tank
or through the control valve and the pump jacks

Oil from the rear pump is fed to the left travel motor through the control valve and the relief port.

When the right travel lever is pushed forward, oil from the center pump flows to P2 and A5 of the control valve. A part of the oil (port 2) goes to A11 of the right travel motor. The return oil flows from B12 of the travel motor to the oil (port 1) port, B5 and T of the control valve and returns to the reservoir through the return line.

When the left hand lever is pushed forward, oil from the rear pump flows to P1 and A2 of the control valve. Oil port of the control port and to A1 of the left hand master. The return oil flows from B1 of the right master to the control port F port, B2 and T of the control valve, and returns to the reservoir through the return line.

When the left or right hand level is shown spread, oil flows in the same way, except that oil is fed in the opposite part of the hand valve.

A counter-balance valve is fitted to each of the left and right travel motors. These work to hold back the machine on hill and to absorb the sudden shocks on starting and stopping.
