

MARYLAND: CLIMATE CHANGE IS HERE AND NOW

CENTER FOR CLIMATE
AND ENERGY SOLUTIONS

The earth is warming and this is largely the result of human-caused emissions. The *National Climate Assessment* (NCA) found that U.S. average temperature has increased by about 1.5 F since 1895 with 80 percent of this increase occurring since 1980. Similarly, the Intergovernmental Panel on Climate Change Fifth Assessment Working Group 1 report (IPCC AR5 WG1), *Climate Change 2013: The Physical Science Basis* came to many of the same conclusions as the NCA, but with a global focus.

The amount of warming that will occur by the end of this century depends on our choices now. If we don't make much progress in curbing emissions, temperatures for the planet could rise between 4.7 to 8.6 degrees Fahrenheit (F)—2.6 to 4.8 degrees Celsius (C)—by the end of this century, compared to the average temperature around the end of the 20th century (1986–2005).¹ Warming in the United States is expected to be higher than the global average. Warming averaged across the country could be between 5 F to 10 F, assuming emissions rates continue. Average summer temperatures in Maryland could increase around 9 F by the end of the century, if little is done to reduce emissions.²

Although we have the opportunity to avoid some of this warming, we are still likely to face a number of impacts arising from climate change in the coming decades. In fact, we are already observing some of these impacts now.

- **Sea level rise** – Sea level has risen about 8 inches in the last 100 years, making coastal storms more damaging and accelerating erosion. Globally, future sea level rise is likely to range from 1 to 4 feet, and could be even higher if glaciers in Greenland or Antarctica melt especially quickly.
- **Polar ice** – Arctic sea ice during the summer has been shrinking, and sometime in the 21st century, perhaps within the next few decades, the Arctic will likely be ice-free in the summer. The ice sheets in Greenland and Antarctica have also been melting more rapidly in recent years, which could increase the rate of global sea level rise.
- **More heavy downpours** – More rain is coming in heavy precipitation events in many parts of the world, including the United States. This may contribute to stronger or more frequent floods.
- **More heat waves** – Heat waves have become more frequent and intense, threatening human health, stressing water resources, and increasing energy demands.
- **Threats to ecosystems** – Many plants and animals will be forced to shift their habitats to higher elevations or higher latitudes as warming makes it more difficult to thrive in their current locations.
- **Increased agricultural pests** – With milder winters, many pests and pathogens that affect plants and livestock have been able to migrate to new areas, posing problems to farmers and ranchers.
- **Ocean acidification** – Increased carbon dioxide in the atmosphere has caused the oceans to become more acidic. Further acidification could dissolve the shells of many organisms at the bottom of the food chain, threatening to disrupt the ocean ecosystem.

These impacts pose challenges to infrastructure, businesses, and communities, particularly in countries already struggling to meet the basic food, water, shelter, and security needs of their citizens.
