	(i)	Describe 2 nd and 3 rd generation of operating system.	4
	Ans:	Second generation: 1955-1965 Around 1955, transistors were introduced. The transistor was far superior to the vacuum tube, allowing computers to become smaller, faster, cheaper, more energy-efficient and more reliable than their first-generation predecessors. Second-generation computers relied on punched cards for input and printouts for output. Assembly language which allowed programmers to specify instructions in words, introduced as second generation language Then IBM-7094-a faster and larger computer came into picture. In that, control cards were in use. In this system, cards were arranged as a stack to save CPU time. All these cards were then read one by one and copied onto a tape using a 'card to tape' utility program. The prepared tape was taken to the main computer and processed. • Technology used: Transistor • Memory: Magnetic core technology • Programming: Assembly level language • Example: IBM-1401, IBM-7094, IBM 1620, CDC 3600 Advantages: • Smaller in size as compared to first generations computers. • More reliable. • Less heat generated as compared to first generation machine.
