Software Engineering for Embedded

Systems Mark Pitchford,2013-04-01 State of the art techniques and best practices in the development of embedded software apply not only to high integrity devices such as those for safety critical applications like aircraft flight controllers car braking systems or medical devices but also to lesser integrity applications when the need to optimize the effectiveness of the available test time and budget demands that pragmatic decisions should be made To complement this multitude of software test techniques there is a similar plethora of test tools available to automate them These tools are commonplace in the development of safety critical applications but elsewhere not everyone has the budget to buy all or indeed any of them Of course the providers of these tools would advocate the purchase of each and every one of them so how can a limited budget best be allocated And where no budget exists how can similar principles be applied to provide confidence that the finished item is of adequate quality In addressing these issues not only are the concepts behind the techniques presented but also some case study software code examples to drill a little deeper and illustrate how some of them are implemented in practice
