Modeling and Simulation of an Induction Motor Using

MATLAB/Simulink for Fault Analysis Abdullah Fahim Ibrahim Yim, 2005

Modeling and Control of AC Machine using

MATLAB®/SIMULINK Mourad Boufadene, 2018-12-20 This book introduces electrical machine modeling and control for electrical engineering and science to graduate undergraduate students as well as researchers who are working on modeling and control of electrical machines. It targets electrical engineering students who have no time to derive mathematical equations for electrical machines in particular induction machine IM and doubly fed induction machines DFIM. The main focus is on the application of field oriented control technique to induction motor IM and doubly fed induction motor DFIM in details and since the induction motors have many drawback using this technique therefore the application of a nonlinear control technique feedback linearization is applied to a reduced order model of DFIM to enhance the performance of doubly fed induction motor. Features Serves as text book for electrical motor modeling simulation and control especially modeling of induction motor and doubly fed induction motor using different frame of references Vector control field oriented control is given in more detailed and is applied to induction motor. A nonlinear controller is applied to a reduced model of an doubly induction motor associated with a linear observer to estimate the unmeasured load torque which is used to enhance the performance of the vector control to doubly fed induction motor. PID and Predictive Control of Electrical Drives and Power Converters using MATLAB / Simulink

Liuping Wang, Shan Chai, Dae Yoo, Lu Gan, Ki Ng, 2014-12-17 A timely introduction to current research on PID and predictive control by one of the leading authors on the subject. PID and Predictive Control of Electric Drives and Power Supplies using MATLAB Simulink examines the classical control system strategies such as PID control feed forward control and cascade control which are widely used in current practice. The authors share their experiences in actual design and implementation of the control systems on laboratory test beds taking the reader from the fundamentals through to more sophisticated design and analysis. The book contains sections on closed loop performance analysis in both frequency domain and time domain presented to help the designer in selection of controller parameters and validation of the control system. Continuous time model predictive control systems are designed for the drives and power supplies and operational constraints are imposed in the design. Discrete time model predictive control systems are designed based on the discretization of the physical models which will appeal to readers who are more familiar with sampled data control system. Soft sensors and observers will be discussed for low cost implementation. Resonant control of the electric drives and power supply will be discussed to deal with the problems of bias in sensors and unbalanced three phase AC currents. Brings together both classical control systems and predictive control systems in a logical style from introductory through to advanced levels. Demonstrates how simulation and experimental results are used to support theoretical analysis and the proposed design algorithms. MATLAB and Simulink tutorials are given in each chapter to show the readers how to take the theory to applications. Includes MATLAB and Simulink

software using xPC Target for teaching purposes. A companion website is available. Researchers and industrial engineers and graduate students on electrical engineering courses will find this a valuable resource.

Alassouli, 2018-03-08. Matlab SimPowerSystems is a modern design tool that allows scientists and engineers to rapidly and easily build models that simulate power systems. Not only can you draw the circuit topology rapidly but your analysis of the circuit can include interactions with mechanical, thermal, control and other disciplines. The paper covers some case studies that provide detailed realistic examples of how to use SimPowerSystems in power system analysis. The following types of studies are covered on the paper: 1. Thyristor Based Static Var Compensator: Study the steady state and dynamic performance of a static var compensator (SVC) on a transmission system. 2. Transient Stability of a Power System with SVC and PSS: Study of the application of static var compensator (SVC) and power system stabilizers (PSS) to improve transient stability and power oscillation damping of the system. 3. GTO Based STATCOM: Study the steady state and dynamic performance of a static synchronous compensator (STATCOM) on a transmission system. 4. Control of load flow using UPFC: Study the steady state and dynamic performance of a unified power flow controller (UPFC). 5. Variable frequency Induction Motor Drive: Study of a PWM inverter is used as a variable voltage variable frequency source to drive an induction motor in variable speed operation. 6. Chopper Fed DC Motor Drive: Study of a DC motor drive with armature voltage controlled by a GTO thyristor chopper. 7. VSC Based HVDC Link: Modeling of a forced commutated voltage sourced converter (high voltage direct current VSC) HVDC transmission link.

Vector Control of Induction Motor Using MATLAB Langsi Yao, 2012-05. Nowadays vector control of induction motor drives are increasingly employed in industrial drive systems. Motor works on best performance at certain voltage and frequency for certain loads. This project describes a generalized model of the three phase induction motor by using vector control method and its computer simulation using MATLAB/SIMULINK. It presents the advances made in vector control as applied to high performance AC motor drives. By using this application it can achieve speed control by controlling the reference speed value and torque value to keep the electromagnetic torque at a constant value. Machine models in d q representation, implementation issues with AC induction motor inverters and converters, parameter effects for induction motor vector control are dealt with and simulation results from the project are presented and discussed by computational calculation and graphs to support this theory. The large scope in this model can lead the algorithm designers to direct their efforts to the promising areas and avoid impossible tasks. From this project the readers can approximately understand the principle of vector control in three phase AC induction motor drive.

Hysteresis Current Control Technique for Three Phase Induction Motor (matlab Simulink & Arduino) ,2014 [Simulation of Electrical Faults of Three Phase Induction Motor Drive System](#) Muhammad Alif Mohd Nor,2009 The title of this project is Simulation of electrical faults of three phase induction motor drive system Induction motor or asynchronous motor is a type of alternating current motor where power is supplied to the rotor by means of electromagnetic induction Induction motor is now the preferred choice for industrial motor due to their rugged construction absence of brushes which are required in most DC motors and the ability to control the speed of motor The faults that can occur in the three phase induction motor and its driver can be divided into two parts internal and external faults The internal fault of induction motors account for the proportion almost more than 70% of induction motor failures This project will cover and study a few type of internal and external faults which is the stator inter turn short circuit unbalanced voltage supply and the single phase open circuit fault The study of induction motor is crucial and important so that the lifespan of the motor can be prolonged In this project MATLAB SIMULINK is used to simulate the induction motor faults and analyze the condition The simulation file is then compiled along with a GUI to simplify the overall process and improves the user friendliness to users
