Ageing of Infrastructure Frank Collins, Frédéric Blin, 2018-09-21 The book addresses the problem of ageing infrastructure and how ageing can reduce the service life below expected levels The rate of ageing is

affected by the type of construction material environmental exposure function of the infrastructure and loading each of these factors is considered in the assessment of ageing How do international design codes address ageing Predictive models of ageing behaviour are available and the different types empirical deterministic and probabilistic are discussed in a whole of life context Life cycle plans initiated at the design stage can ensure that the design life is met while optimising the management of the asset reducing life cycle costs and reducing the environmental footprint due to less maintenance remediation interventions and fewer unplanned stoppages and delays Health monitoring of infrastructure can be conducted via implanted probes wired or wireless or by non destructive testing that can routinely measure the durability loading and exposure environments at key locations around the facility Routine monitoring can trigger preventative maintenance that can extend the life of the infrastructure and minimise unplanned and reactive remediation while also providing ongoing data that can be utilised towards more durable future construction Future infrastructure will need to be safe and durable financially and environmentally sustainable over the lifecycle thereby raising socio economic wellbeing The book concludes by discussing the key impacting factors that will need to be addressed The author brings a strong academic and industry background to present a resource for academics and practitioners wishing to address the ageing of built infrastructure

**Social Stratification in an Aging Society with Low Fertility** Sawako Shirahase,2022-08-31 This edited book empirically discusses stratification in contemporary Japanese society It is unique for its examination of social inequality in relation to declining fertility and an aging population Japan is the most aged society in the world according to the Statistics Bureau of Japan people who are aged 65 and above comprised 29.1% of the country's total population in 2021 Meanwhile the fertility rate has continuously declined since the mid 1970s Japan experienced a dramatic change in its demographic structure in a short period of time Such fast change could be a major factor that generated social stratification In her industrialization Japan was thought to share a pattern of social stratification similar to that of developed European and North American countries but with a low degree of socio economic inequality and a high degree of homogeneity There is no clear support for this description of Japan although the country does share a pattern and degree of social stratification similar to that observed in Europe and North America The social stratification theory has been developed in close relationship to the labor market however it is necessary to further examine the social stratification of very aged societies in which a substantial number of the population namely retired persons no longer have any ties to the labor market In this book the contributors explore the pattern of social stratification at three life stages young middle aged and elderly Included are discussions of various aspects of stratification such as education work wealth marriage family gender generation and social attitudes
