French mathematician Lie Cartan 1869-1951 was one of the founders of the modern theory of Lie groups a subject of central importance in mathematics and also one with many applications In this volume he describes the orthogonal groups either with real or complex parameters including reflections and also the related groups with indefinite metrics He develops the theory of spinors he discovered the general mathematical form of spinors in 1913 systematically by giving a purely geometrical definition of these mathematical entities this geometrical origin makes it very easy to introduce spinors into Riemannian geometry and particularly to apply the idea of parallel transport to these geometrical entities The book is divided into two parts The first is devoted to generalities on the group of rotations in  $n$  dimensional space and on the linear representations of groups and to the theory of spinors in three dimensional space Finally the linear representations of the group of rotations in that space of particular importance to quantum mechanics are also examined The second part is devoted to the theory of spinors in spaces of any number of dimensions and particularly in the space of special relativity Minkowski space While the basic orientation of the book as a whole is mathematical physicists will be especially interested in the final chapters treating the applications of spinors in the rotation and Lorentz groups In this connection Cartan shows how to derive the Dirac equation for any group and extends the equation to general relativity One of the greatest mathematicians of the 20th century Cartan made notable contributions in mathematical physics differential geometry and group theory Although a profound theorist he was able to explain difficult concepts with clarity and simplicity In this detailed explicit treatise mathematicians specializing in quantum mechanics will find his lucid approach a great value

*A Course in Advanced Calculus* Robert S. Borden, 2012-09-11 This remarkable undergraduate level text offers a study in calculus that simultaneously unifies the concepts of integration in Euclidean space while at the same time giving students an overview of other areas intimately related to mathematical analysis The author achieves this ambitious undertaking by shifting easily from one related subject to another Thus discussions of topology linear algebra and inequalities yield to examinations of innerproduct spaces Fourier series and the secret of Pythagoras Beginning with a look at sets and structures the text advances to such topics as limit and continuity in  $\mathbb{R}^n$  measure and integration differentiable mappings sequences and series applications of improper integrals and more Carefully chosen problems appear at the end of each chapter and this new edition features an additional appendix of tips and solutions for selected problems
